**General index to the archive**

Site/Project Name:  **Winchester, Lankhills Special School**

Site Code:  **WINCM:AY21**

Site/Project Type:  **Excavation & Watching brief**

Year(s):  **2002-2004**

Accession Number:  **WINCM:AY21**

Please note the primary records for the evaluation phase have already been microfilmed and are not included as part of this scanned archive. This archive has also been scanned in two parts, the first part consists of the primary data and the second part consists of the finds, photographs and environmental data. The post excavation analysis of all phases was undertaken as one and therefore the data produced during the post excavation process for all phase is included in part two of the scanned archive. The final phase of work was carried out under the code WINCM:AY226 and should be viewed in conjunction with this archive.

POST-EXCAVATION ASSESSMENT AND UPDATED PROJECT DESIGN

SUMMARY

Four phases of excavation and watching brief work were carried out by Oxford Archaeology for Hampshire County Council at Lankhills Special School from 2000-2005, in advance of and during redevelopment. These recovered significant new evidence relating to the previously-known late Roman cemetery partially excavated by Giles Clarke in 1967-1972. The northern boundary of the cemetery, defined by a ditch, was identified and the early 4th century eastern boundaries defined by Clarke were seen to continue to the original north-east corner of the cemetery. Within the cemetery were two possible small grave enclosures defined by gullies. More prominent were two clusters of pits which served as foci for intensive burial activity, including concentrations of cremation burials. The alignment of graves related to that of boundaries, with a gradual west to east swing from WSW-ESE alignments to more nearly west-east ones. Small numbers of north-south aligned graves were also present as in the earlier excavation. A total of 349 graves was revealed, including four previously completely excavated by Clarke. Twenty seven graves which extended beyond the limits of the excavation and thus could not be fully excavated were left in situ. The remaining 318 graves, including seven partially excavated by Clarke, were fully excavated. Of these, 288 produced human remains, in addition to which 26 cremation burials were identified.

Preservation of the inhumations was very variable. The total assemblage comprised 222 adults and 66 subadults. Of 122 adults which could be sexed at this stage 43 were female and 79 were male. The relatively poor representation of infants and children may represent the effects of age-related zoning in the cemetery, but more likely indicates that neonates and infants, in particular, were regularly buried in settlement contexts rather than formal cemeteries. Mature (35+) and older (45+) adults were well-represented. Non-metric traits such as two instances of retention of the metopic suture into adulthood and two of the third molar emergence with a single root were observed in the assessed sample. These traits may be useful in suggesting familial links between individuals buried within the cemetery. Other non-metric traits may have developed as a result of occupational stress. The majority of pathologies observed were associated with the degeneration of the joint surfaces. Fractures were also observed and were well healed and aligned. There was a low level of cribra orbitalia (due to iron deficiency anaemia). These pathologies suggest a reasonable level of general health and diet of the population. One particularly interesting and unusual pathology was premature cranial suture closure (scaphocephaly, heel-shaped skull). There was also a case of auditory torus (small bony growths in the ear, which may cause deafness). These two conditions may have been apparent to the community in which these individuals lived.

The majority of the burials were within wooden coffins. Grave goods occurred in approximately 25% of inhumations and included coins, pottery and glass vessels and a wide variety of personal items of jewellery and dress accessories. Unusual vessels included a small spouted glass jug, and
two pottery flasks from the Trier region came from a single grave. Small objects of particular interest were an inscribed bone plaque, a hollow copper alloy bracelet, and six crossbow brooches. One of these was gilded and was found in a grave with silver belt fittings and a pair of copper alloy spurs, the latter a unique occurrence in a grave in Roman Britain.

The potential of the diverse classes of evidence (site layout and grave structures, human remains and the range of artefact types) for integrated analysis to produce a comprehensive account of the cemetery is very high, particularly when combined with the data already existing for Clarke's excavation. The site is one of only a small number of late Romano-British urban cemeteries with substantial, well-excavated samples, and in a number of significant aspects remains unparalleled.

It is proposed that full publication of the results of the 2000-2005 excavation is required, and that the results of Clarke's excavation should be integrated as fully as possible with it. The report will present an account of the excavation, a detailed grave catalogue and a discussion of the cemetery with relation to a wide range of aspects of morphology, chronology, human population, burial rite, artefact analyses and the social, political and economic conclusions that can be drawn from these studies. The report will be illustrated appropriately, including illustration of all significant grave groups, in line with the accepted general principle that complete grave groups should always be illustrated in full. A wider discussion will set the cemetery in its Romano-British context and will, as far as is possible, take account of relevant continental evidence.
1 INTRODUCTION

1.1 Scope and structure of document

1.1.1 This document is a post-excavation assessment, updated project design and publication proposal for the site archive generated by fieldwork undertaken by Oxford Archaeology at Lankhills Special School, Winchester. It sets out the research framework and proposed methods for the analysis and report preparation as prescribed by MAP2 (English Heritage 1991).

1.1.2 Section 1 of the report describes the background to the project, including a description of previous archaeological investigations at Lankhills Special School. Sections 2 and 3 define the original research aims of the project and Section 4 describes the methodology employed during the fieldwork stage.

1.1.3 Sections 5-8 present the results of the fieldwork. A tabulated summary of the total site archive is given followed by an assessment of the stratigraphic, artefactual and palaeo-environmental evidence, including a statement of potential for each category.

1.1.4 Sections 9 and 10 present an updated project design and proposed method statements for an appropriate level of analysis for each category of evidence.

1.1.5 Sections 11 and 12 are concerned with the dissemination of results. The options for publication are considered and a synopsis of the proposed publication is provided, together with an outline of the work and associated costs required for its completion. The provisional programme of work and the proposed resources to achieve objectives are given in tabulated and Gantt format.

1.1.6 It should be noted that the proposed programme of work will be carried out under a ‘measured’ contract. This is based on a bill of nominal quantities (originally a notional 200 excavated burials), adjusted in the light of the actual excavated quantities of burials and other features.

1.1.7 Finally, section 13 contains a bibliography, and is followed by appendices containing additional tabulated data.

1.2 Location and scope of fieldwork

1.2.1 Oxford Archaeology was commissioned by Hampshire County Council in 2000 to undertake an archaeological excavation at the site of Lankhills Special School, Winchester (OA 2000). The school is located in the northern part of Winchester, in the triangle of modern development between the A272 Andover Road and the A33 Basingstoke Road at NGR SU 479 304 (Fig. 1). These roads follow the line of the former Roman roads leading toward Cirencester and Silchester respectively, running from the north gate of the Roman city of Winchester, c 450 m to the south of the site. The excavation was occasioned by a re-organisation of the school facilities and the preparation of part of the grounds for sale for redevelopment. Previous excavations carried out in the southern part of the school grounds between 1967 and 1972 (Clarke 1979) had recorded a total of 451 burials forming part of a major late Roman cemetery that extended for an unknown distance into the surrounding area.
1.2.2 The excavation comprised two phases of detailed investigation in the vicinity of the School House at the southern end of the site, contiguous with the area of the earlier excavations (Fig.2). A watching brief was also maintained on groundwork carried out during the redevelopment of the central part of the school grounds. This work was undertaken in accordance with a Project Design agreed with Hampshire County Council and based on a Design Brief prepared by Michael Heaton of Archaeological Site Investigations in conjunction with Hampshire County Council, English Heritage, Winchester City Council and Giles Clarke.

1.2.3 Subsequent to this work, drainage works carried out in 2005 resulted in a further small scale watching brief being commissioned by Laing Homes. This investigation was carried out in accordance with a WSI agreed with Tracy Matthews of Winchester City Council. The results of this work are included in the present assessment and will be incorporated into the proposed programme of analysis and reporting.

1.3 Geology and Topography

1.3.1 Winchester is located at the southern edge of the chalk Downs of Wessex. The site of Lankhills lies in a localised area of Lower Chalk within the otherwise Middle and Upper Chalk of the Downs.

1.3.2 The site is situated on a spur of land between the Itchen Valley to the east and the valley of a small stream, the Fullflood, to the south. The school grounds comprise a series of level terraces corresponding with existing and past buildings and the sports field. Geotechnical investigations have recorded the presence of made ground up to 1.5 m deep in places.

1.4 Archaeological Background

1.4.1 Winchester is one of the principal historic towns of southern England. Despite this, and a number of antiquarian observations, its Roman archaeology was not well known before the 1920s and systematic excavation did not begin until the late 1940s (Qualmann 1993, 67), initiated by staff of the Winchester Museum and developing into the Winchester Excavations Committee programme initiated in 1961. This and subsequent work by the Archaeological Section of Winchester Museum Service has created an extensive and detailed archaeological database from which the origins and development of the town can be studied, although much work is still unpublished. Between the walled city and the site of Lankhills, observation made by antiquarians during the suburban expansions of the 19th and 20th centuries and subsequent excavations, have produced information on the cemeteries in this area which provides important background for the understanding of Lankhills. Again, however, this work, including relatively recent excavations (e.g Teague 1999) have not been published in detail.

1.4.2 The Roman town of Winchester, *Venta Belgarum*, was established in the 1st century AD. Its location was probably determined in part by the presence of an Iron Age tribal centre at the enclosed site of Orams Arbour, part of which underlies the western part of the later walled town. As the civitas capital for the Belgae, Winchester became one of the largest towns in Roman Britain, and was a major administrative and economic centre. The existence of cemeteries outside the northern defences of the Roman city, lining the principal Roman roads, has been known since at least the mid 19th century.
1.4.3 The late Roman cemetery is the principal focus of archaeological interest at Lankhills. There is no direct evidence of earlier settlement on the site, although a scatter of struck flint and prehistoric pottery suggests the presence of prehistoric settlement in the vicinity. There is equally no direct evidence for Anglo-Saxon and medieval features. The name Lankhills may indicate the presence of lime kilns, probably of post-medieval date (Clarke 1979, 5), but the first clear indications of post-Roman activity are associated with the development of the area for large houses in the 19th century.

*Previous archaeological investigations at Lankhills*

1.4.4 Though outside the Roman settlement, Lankhills Special School is situated within the fork of the two Roman roads that linked Winchester with Cirencester and Silchester, now represented by the A272 Andover Road and the A33 Basingstoke Road. Human remains discovered during building work at the School in 1961 (Clarke 1979) suggested that the northern cemetery of the Roman city of Winchester extended as far as Lankhills, leading to an area excavation carried out between 1967-72.

1.4.5 In its initial phase the cemetery appeared to be bounded by a linear ditch along its eastern edge, but later Roman burials extended east of this line. Stripping of large areas to the north subsequent to Clarke’s excavation revealed no burials, indicating that the northern boundary of the cemetery was likely to fall within the southern end of the site, in the vicinity of the School House block. Nonetheless, isolated burials were likely to occur outside this boundary. The density of burials decreased in the eastern part of Clarke’s excavation, but the eastern boundary of the cemetery was not identified with complete certainty.

1.4.6 The excavations of 1967-72 revealed 451 burials. Evidence for coffins was present in 83% of graves, while grave goods were found in a high percentage. The majority of burials were aligned approximately west-east; a WSW-ENE alignment, determined by the line of the Cirencester road, giving way to a more nearly west-east alignment within the excavated area. The burials appeared to be entirely of 4th century or very early 5th century date. Stratigraphic and artefactual analysis led the excavator to conclude that the cemetery had, developed as an agglomeration of nucleated burial groups, possibly representing families, with a chronological trend towards the east and with the later graves being the shallowest and displaying a ‘sloppiness’ of excavation and positioning. He further concluded that the cemetery contained the interments of a number of eastern European migrants and later, Saxon, settlers.

1.4.7 Within the area excavated during 1967-72, graves clearly extended beyond the limits of the excavation to the north, south and west.

1.5 **Acknowledgements**

1.5.1 The excavation was commissioned and funded by Hampshire County Council and monitored on their behalf by Michael Heaton of ASI Heritage Consultants. Ian Wykes also gave advice and encouragement, as did the original excavators, Giles Clarke and Jock Macdonald. The work of all the site staff and the contributors to this assessment is acknowledged. Martin Henig in his role as academic advisor kindly read and commented upon a complete draft of the document.
2 ORIGINAL RESEARCH AIMS

2.1.1 The original research aims, as detailed in the OA Project Design (OA 2000), were divided into three broad categories, as follows:

1. Cemetery morphology and grave structure

2.1.2 Comparison with other sites suggests that in these respects Lankhills does not stand out as displaying particularly unusual characteristics. Nevertheless in a local and regional context it is important to:

- Establish the extent and density of burials;
- Identify and characterise boundaries defining the cemetery and other features which may have constrained its extent and development;
- Establish the developmental sequence and (as far as possible) the absolute chronology of the cemetery;
- Identify important graves and other features which may have influenced the internal layout of the cemetery;
- Establish the physical characteristics of unusual or potential high-status graves;
- Identify evidence for in situ cremation and the existence of pyre dumps;
- Assess the evidence for structured deposition within cremation deposits.

2. Finds assemblages from graves

2.1.3 The principal general aim is to ensure a level of recording which will allow direct comparison with the results of Clarke’s excavation. Particular issues to be addressed are:

- The incidence and form of coffins. Coffins were very common in Clarke’s excavation, though their forms and construction were not considered in detail by him. Three-dimensional location of nails and other fittings may shed light on these questions;
- Burial rite and beliefs. These aspects can be examined using associated artefacts to consider questions such as dress (eg. whether or not jewellery and shoes were worn) and the functional aspects of some artefact classes - particularly vessels. Both glass and ceramic vessel assemblages from the 1967-72 excavations were heavily skewed in favour of liquid containers and drinking vessels. This seems to be characteristic of late Roman cemetery assemblages elsewhere in Britain and must be significant in relation to beliefs about the afterlife (see D.4.3 which outlines methods for residue analysis;
- Aspects of location of grave goods, with further implications for understanding of burial ritual and beliefs. Variation in such locations was one of the criteria used by Clarke in defining ‘intrusive’ burials, though the specific methodology used to isolate them has been questioned (eg. Baldwin...
1985). The most basic distinction observable is between placing inside or outside the coffin: some artefact classes (eg. combs) were invariably placed within the coffin, while others (eg. pottery vessels) were found both within and beside the coffin. Computer analysis was used by Clarke to identify associations of particular object types, but not to assess the statistical validity of such associations or of variations in object location within graves. This will be attempted. The significance of other correlations, for example of age and gender with grave good types and locations, can by analysed in the same way:

- The occurrence and distribution of particular artefact types illuminating questions of social, economic and other aspects of status, such as the identification of possible official or military personnel. Artefact types such as crossbow brooches and belt fittings, which might have a bearing on the latter question, can be considered in the light of more recent work on such material, and in particular significant developments in understanding the quantities, distribution and sources of insular belt fittings. (Corney and Griffiths forthcoming);

- To refine the dating evidence of the graves. Clarke concluded that the cemetery contained an unusually high proportion of furnished 4th-century burials;

- To what extent can artefact associations be used in the identification of ethnic groups (eg. it is sometimes claimed that the deposition of knives was a peculiarly Germanic custom);

- To what extent can we trace variations in the standard of burial over time particularly with regard to infant burial;

- To locate the northern boundary of the cemetery. The total absence of burial related finds north of the College House/School House complex suggests that it falls within the south-west quarter of the Lankhills School site;

- Were pottery vessels made specifically for burials?

- Can we determine what pottery vessels contained prior to, or at the time of deposition?

3. The cemetery population

- Identification of ethnic groups. Clarke identified ethnic groups from the Danube region as well as early Saxons, largely on the basis of distinctive burial types confined (initially) to a relatively brief period which he suggested showed a remarkable consistency in the type of artefacts present and in their position within the grave. This has not been universally accepted nor (perhaps more importantly) has the specific methodology used to isolate them (eg Baldwin 1985). It has also been argued that the identification of ethnic origin from burial customs, once fashionable, can be shown to be problematical (Philpott 1991, 233-4). The existence of foreign groups in the populations, and hence the cemeteries, of some of the larger towns (in particular) of Roman Britain is not inherently implausible, though such groups have very rarely been identified. The Lankhills cemetery nevertheless contains one of the best potential examples of such a group, and in the event
of the identification of further members of Clarke’s ‘intrusive’ groups (on the criteria established in the 1979 report) new analytical techniques can be used to shed further light on the validity of the identification;

- The collection of small samples of human bone for analysis to further the development of scientific analysis of skeletal remains to answer project specific questions relating to ethnic origins of the burial population will be undertaken. Recent work indicates the effectiveness of scientific methods for the study of human skeletal remains in funerary contexts where issues such as diet and disease have been addressed. In particular DNA work is important for the analysis of genetic relatedness, identification of sex and the DNA of the bacterium responsible for infectious disease, eg TB (see D.4.1);

- To recover evidence to aid our understanding of decapitation (possibility of human sacrifice);

- To retrieve samples for trace element and stable isotope analysis to elucidate geographical history and dietary base of human material;

- Genetic studies of kinship in burial groups;

- Social patterning (gender, class, family groups);

- To establish the biologically determined demographic structure of the sample. Clarke concluded that the cemetery contained an unusually high proportion of burials which could be sexed on the basis of associated objects;

- To assess the inter-relatedness of the group through biological methods;

- To investigate and interpret pathological manifestations and patterns within the sample;

- To provide a detailed record of the skeletal group prior to its final reinterment.
3 Excavation Methodology

The excavation programme

3.1.1 The excavation was carried out in two main phases (Table 1). The initial phase comprised excavation in 2000 of six areas around and to the north of the School House and an area between the site of the 1967-1972 excavation and the southern boundary of the school grounds (Fig. 3, Areas 1-7). These excavations were contiguous with the earlier excavation. A watching brief was maintained during the demolition of the School House during September and October 2003 and a further phase of excavation was carried out within its footprint between November 2003 and March 2004.

3.1.2 In addition to this a watching brief was maintained on groundworks elsewhere within the school grounds. A further watching brief during the excavation of a soakaway during April 2005 recorded a further five graves.

Removal of overburden

3.1.3 In each phase of the investigation modern overburden was removed under close archaeological supervision using a 360° excavator fitted with a toothless ditching bucket. In addition to this a watching brief was maintained during the removal of the footings of the former School House prior to the 2003-2004 excavation. The fill of a former pump room within the northern part of School House was emptied using the machine. Apart from this the fills of service trenches and other modern intrusions were removed by hand. The entire site was cleaned by hand in order to define archaeological feature.

Inhumation Burials

3.1.4 Recording of inhumations was carried out in accordance with the recommendations of IFA Technical Paper No. 13 (McKinley and Roberts 1993) and the OA Field Manual (OA 1992).

3.1.5 Each burial was assigned a group number. Each individual context, including the grave cut, grave fill, skeleton, coffin, coffin fill, and deliberately deposited grave goods was issued a unique context number from a continuous running sequence. Pottery vessels, deposits of hobnails, and other grave goods were also assigned unique small find numbers. During the 2000 phase skeletons and associated grave goods were planned by hand at a scale of 1:10; in the 2003-4 excavation and the 2005 watching brief they were recorded by means of geo-referenced photography, from which digital plans were generated using a CAD programme. Skeletons were recorded using pro forma sheets which recorded the preservation and completeness of the skeleton, the presence of individual bones, and body
position. A black and white and colour slide photographic record was made of each burial.

3.1.6 An osteologist examined each inhumation in situ to make a preliminary assessment of age and sex. Samples for DNA analysis were collected from well-preserved skeletons by an osteologist wearing suitable protective clothing in order to avoid contamination with modern DNA. Bulk samples of soil from the abdomen, chest and neck areas of each skeleton were retained for sieving in order to recover any calcified soft tissues, calcified masses (eg. gall, bladder, urinary stones) or foetal bones. Samples were also taken from around the hands and feet to ensure complete bone recovery, and from around the head area to recover any teeth that had come loose from their sockets.

3.1.7 Coffin nails were recorded by means of a combination of hand-drawn plans recorded at a scale of 1:10, and levelling relative to Ordnance Datum in order to facilitate re-construction of the form of the coffin.

3.1.8 A post-excavation plan was drawn of each grave at a scale of 1:10. Grave profiles were also drawn at a scale of 1:10.

Cremation Burials

3.1.9 Each cremation burial was assigned a group number. All cremation burials were subjected to full recovery to maximise the retrieval of cremated bone, charred plant remains and small artefacts. Each individual context, including the cut of the cremation pit, the cremation urn, the cremation deposit, and the back-fill was given a unique context number and recorded on a pro forma sheet. The cremation pit, urn and any other contents were planned at a scale of 1:10 and recorded photographically on colour and black and white. Where sufficiently well preserved, the cremation urn was lifted intact with the cremation deposit in situ for laboratory excavation by an osteologist.

3.1.10 Un-urned cremations were half sectioned in order to record the distribution of archaeological components, followed by completion of the 100% excavation of the feature. Un-urned cremation deposits were lifted in their entirety to enable full recovery of cremated bone, charred plant remains and small artefacts. Sections and plans of un-urned excavations were recorded at a scale of 1:10, and a photographic record made in colour and black and white.

Other Discrete Features

3.1.11 All other discrete features were excavated and planned at a scale of 1:10. Generally features were fully excavated, although features of low archaeological significance, such as tree throw holes, were generally half sectioned.

Linear features

3.1.12 Each linear feature was assigned a group number. Linear features were sampled by excavation of sections regularly spaced along the length of the feature sufficient to characterise the feature and its sequence of fills, to establish any stratigraphic relationships with other features, and to retrieve artefactual material and environmental samples.
4 THE SITE ARCHIVE

4.1.1 The fieldwork generated the following archive:

5   

**ASSESSMENT OF STRATIGRAPHY**

5.1  

The integrity of the stratigraphic sequence

5.1.1  
The site had been subject to landscaping during the construction of the School House in the 1960s. The natural topography of the site, which sloped gently to the east, had been artificially levelled by the deposition of bands of chalk and topsoil up to a thickness of 0.8 m across the eastern half of the site. The western part of the site may also have been slightly truncated at this time. Along the eastern edge of the excavation an earlier soil layer 0.2 m thick was recorded, preserved beneath the made ground. This was interpreted as being agricultural in origin and suggests that archaeological features are likely to have been truncated by post-Roman ploughing. This ploughing is likely to have removed at least 0.2 m of material, resulting in the loss of the shallowest features, possibly including the shallowest graves and any grave markers or other features associated with the use of the cemetery. Offerings deposited on the contemporary ground surface such as those found by Clarke around the mound of his Grave 323 would also have been lost through this process.

5.1.2  
Foundations and service trenches associated with the former School House had penetrated into the natural chalk across a substantial part of the excavation area (Fig. 3). The degree of truncation was variable across the site. In the eastern part of the site the effect was minimal as the made ground in this area acted as a buffer protecting the deposits below. Across much of the site the footings of the former building intruded 0.3 m - 0.5 m into the chalk substrate. The most severe truncation was located in the north-western part of the site, particularly in the area of a former pump room basement that had been dug c. 1 m into the chalk bedrock. With the exception of the former pump room, however, the impacts of these modern intrusions were restricted to the lines of the foundation and service trenches, leaving most of the site, including all of Area 1, unaffected.

5.1.3  
The loss of graves through truncation clearly has implications for analysis of the spatial distribution of burials. This is most clearly demonstrated in the north-central area of the excavation, where the dense concentration of inter-cutting features in the central part of the site contrasts sharply with the thinner distribution of graves surviving in the heavily truncated area immediately to the north. The evidence of those parts of the site unaffected by such truncation indicates that genuine variations in the density of burials were a feature of the cemetery, as had been noted by Clarke. Clarke’s excavation, located in an area unaffected by modern buildings, had also found that the later graves and those of infants tended to be rather shallower than the other examples, and the potential loss of such shallower features due to truncation may result in their being under-represented, particularly within the footprint of the former School House.

5.2   

Summary of excavation results

*Cemetery boundaries*

5.2.1   
The northern limit of the cemetery was located, clearly defined by an east-west ditch (1318) (Fig. 4). Excavation extended sufficiently far beyond the ditch to demonstrate that no burials were located to the north of this boundary, and this was further confirmed by the complete absence of burials from the watching brief areas in the central and northern parts of the school grounds. The terminal ends of three ditches which may also have marked this northern boundary at
different stages in the history of the cemetery extended into the north-eastern part of the excavation.

5.2.2

Three features were identified that had probably defined the eastern boundary of the cemetery at some stage in its development. These were a ditch (450), a gully (470) and a band of pits that may have been the remains of a former hedgerline (460). These features corresponded with similar boundary features recorded by Clarke, and as in the earlier excavation they were cut by numerous graves, indicating that the cemetery had expanded eastward across them. The burial of an infant had been placed on the base of ditch 450, and the uppermost layer filling the ditch was a possible turf line that sealed at least two cremations and pre-dated the later graves, indicating that the ditch had been in existence for some time before graves began to be dug into its fill. In Clarke’s excavation it was found that graves were dug into the fills of the ditch before it had fully silted up, and were sealed by the uppermost fills, but in the 2000-2004 excavation these upper layers were largely absent, presumably because of the greater truncation of this area resulting from construction activity during the 1960s/1970s. It was not possible to establish how these feature were related to the ditch defining the northern boundary of the cemetery as the gully and hedgerline ended before they reached the northern boundary (albeit in a manner that might suggest that they were set out subsequent to the east-west ditch line) while the northern part of the ditch forming the eastern boundary curved toward north-east so that it did not intersect with the northern boundary within the area of the excavation.

**Chronology and organisation of the cemetery**

5.2.3

The excavation exposed a total of 349 graves, including four that had been previously completely excavated by Clarke. Twenty seven graves which extended beyond the limits of the excavation and thus could not be fully excavated were left in situ. These unexcavated graves were located along the eastern edge of the main excavation area and along the southern margin of Area 1. The remaining 318 graves were fully excavated, including seven which had been partially excavated by Clarke.

5.2.4

Artefactual evidence indicates that burial within this part of the cemetery began during the early part of the 4th century (Fig. 6). The earliest coin-dated grave dated from the 320s (see section 6.2) and the earliest pottery had a date range of AD 270-350 AD (see section 6.1). Burial continued at least until the end of the 4th century, the latest coin-dated graves being two located in the north-western corner of the excavated area containing coins of the House of Theodosius. Of those graves containing coins or pottery relatively few were dated to the second half of the 4th century compared to the number from the first half, but it is uncertain whether this indicated a reduction in the use of the cemetery or a change in burial customs away from the deposition of ceramic grave goods.

5.2.5

The density of the burials varied across the site. In some areas, such as that of the former pump room, this may be the result of greater truncation having removed the shallower graves, but across most of the site it appears to reflect a genuine pattern. Certainly the sparser distribution of graves in the vicinity of the northern boundary of the cemetery and in isolated areas of the southern part of the excavation cannot be explained by modern truncation as these areas lie outside the footprint of the former School House and related disturbances. The overall impression is of a mixture of discrete graves, sometimes separated by isolated
blank areas, and areas of more densely spaced, frequently inter-cutting graves. The evidence for placing of graves in lines or rows was less clear-cut than in the part of the cemetery excavated by Clarke.

5.2.6 In the central part of the excavation there were two, or possibly three, areas of densely inter-cutting features. The primary activity in each of these areas seems to have been the digging of one or more large pits up to 4 m in diameter and 0.8 m deep, after which these areas became favoured locations for subsequent burials. Cremation burials were concentrated in these areas, particularly early in the sequence, and burials with unusual orientations and body positions were also particularly common in these locations. In the case of one such focus, a turfline appears to have formed sealing the earlier graves and indicating a hiatus in the use of this area before the insertion of later burials (see section 8.5). Such areas were not encountered in the part of the cemetery excavated by Clarke, and their significance is currently uncertain.

Inhumations

5.2.7 The graves are generally aligned west-east or WSW-ENE, with the head at the west end. Burials near to the boundaries of the cemetery lay on more strict west-east alignments, as a consequence of being placed parallel to the northern boundary or at right angles to the eastern one, while those further to the south-west tended more toward the WSW-ENE orientation under the influence of the alignment of the adjacent Roman road to Cirencester. A minority of graves exhibit variant alignments. In six instances the body was laid with the head to the east, a reverse of the usual position, and five graves were aligned north-south. The latter included two of the latest graves identified and it is possible that this orientation is a characteristic of the final episode of the use of the cemetery. Two graves were aligned south-north, and in both cases the body had been placed face-down, further emphasising the unusual nature of these burials.

5.2.8 The depth of individual graves varied enormously, from almost nothing up to 1.8 m from the surface of the chalk bed-rock. Four stepped graves were recorded, one of which was the deepest grave in the excavation and contained unusual imported pottery. One grave in Area 1 was singled out by virtue of being enclosed within a rectilinear gully similar to Clarke's features 2, 6, 38 and 40. A possible second example may have been represented by a gully of similar proportions identified in the watching brief area to the west of the main excavation area, although within the confines of the area investigated in the watching brief it was not possible to determine whether this was indeed part of a similar enclosure or represented a feature pre-dating the cemetery.

5.2.9 Burials were usually supine with the head to the west and the hands lying either beside the body or across the pelvis. An estimated two thirds were furnished with wooden coffins, represented by iron nails and other coffin fittings. The preservation of human remains was very variable, as it had been in the part of the cemetery excavated by Clarke. This did not seem to relate to the location or depth of the individual grave and presumably resulted from variations in the micro-environment present within the grave or coffin.

5.2.10 Forty three graves were recorded as containing pottery vessels as grave goods, and six of these graves contained two vessels each. Twenty four burials were accompanied by coins, with seven coins being the largest single group. Other grave goods (see section 6.3) included glass vessels, knives, a set of shears and
combs in addition to potential worn items such as brooches, bracelets, hobnailed boots and belt fittings (not all of these were necessarily worn, however). Outstanding amongst these items were five crossbow brooches (a sixth may have been associated with a cremation). One of these was gilded and came from a grave with a silver belt buckle and amphora-shaped strap end. In the same grave, most remarkably, were two copper alloy spurs. Unfortunately the human remains in this grave were very poorly preserved. Of the metal objects, only the brooch had been worn at the time of burial, being found at the right shoulder. The belt had been placed between the legs and the spurs were found beside the right leg, rather suggesting that the pair of riding boots to which they were attached had been placed end to end beside the body in the coffin. It is fairly certain that this is the first time that spurs, which are not particularly common in Roman Britain, have ever been found in a grave here. Moreover, the type, with three rivet plates rather than the more normal two, is also unusual in a British context.

5.2.11 A number of minority burial rites were identified. These included six prone burials and four decapitations, one of which was an infant buried with bracelets and beads and one an adult buried in a crouched position. One burial was accompanied by the remains of a chicken, and horse skulls had been placed, apparently deliberately, in the back-fill of two graves. In some instances the digging of new graves into existing ones may have been deliberate; certainly in one example the grave appeared to have been deliberately re-opened and a new body inserted, the bones of the original burial having been moved to one side to accommodate the new occupant, and a number of other examples where burials were inserted entirely within the back-fill of earlier graves may similarly represent the conscious re-opening of the earlier grave.

Cremations

5.2.12 A total of 26 cremations was excavated. They were particularly concentrated in the areas of densely inter-cutting features referred to above, where they were usually fairly early in the stratigraphic sequence (Fig. 5). Three distinct forms of cremation burial were recorded. In five examples the cremated remains had been placed in a ceramic vessel, while in 17 cases they were un-urned and placed directly into a purposely dug pit. Four cremations were buried in inhumation-sized pits. All four examples were located in areas of inter-cutting graves, and one appeared to have been deliberately inserted into the back-fill of an earlier example of the same type of feature. The sides of one of these pits was dis-coloured by heat, suggesting that it may have been a bustum burial, and two contained evidence that the body may have been contained within a coffin prior to cremation.

5.3 Statement of potential

5.3.1 The excavation has generated a large database of information, with a correspondingly high potential to address the original research aims of the project, as detailed below:

1. Cemetery morphology and grave structure

5.3.2 Features defining the northern and eastern boundaries of the cemetery were located, although burial subsequently spread into the area beyond the eastern boundary. These boundaries appear to have influenced the orientation of graves in the adjacent parts of the cemetery. Further analysis of finds from the
boundaries and of graves whose locations respect them has the potential to establish when the boundaries were established and when the eastern boundary was superseded.

5.3.3 The absolute chronology of the part of the cemetery within the area of the excavation can be addressed by integrating stratigraphic evidence with artefactual dating evidence, combined with consideration of the alignment and spacing of graves. This aim can be enhanced by an extensive programme of radiocarbon dating. These same sources of information will also help in establishing the developmental sequence of the cemetery. In particular the possibility should be investigated that the absence of any obvious linear organisation to the cemetery, and the frequent occurrence of inter-cutting of graves, may indicate that the cemetery developed fairly organically from multiple foci. The effect of the areas of large pits and of individual important graves on the development of the surrounding areas could also be elucidated by further analysis.

2. Finds assemblages from graves

5.3.4 The three-dimensional recording of the locations of coffin nails will allow the forms and variety of coffin types to be reconstructed. Many of the nails exhibit clear evidence for mineralised wood preserved in corrosion products. From this it will be possible to identify the direction of the grain and the species of wood used. There are still relatively few good comparative data sets relating to coffin size, form and construction in late Roman Britain and a number of significant questions about burial rites which stem from understanding of coffin evidence, particularly in relation to the way in which coffins were covered, are unanswered. The Lankhills evidence can make a useful contribution to consideration of these questions.

5.3.5 The location of grave goods within the grave can shed light on the funerary rites and beliefs of the inhabitants of 4th century Winchester. Of particular significance will be a consideration of whether artefacts were worn or placed with the body, and whether they were within or outside the coffin. The location of artefacts was one of the criteria used by Clarke in identifying the burials of intrusive groups of foreigners in the area excavated in 1967-1972. The excavation has also identified artefacts placed, apparently deliberately, within the back-fill of graves, which may represent a further aspect of burial ritual. The present sample is sufficient in both size and quality to allow new analyses along these lines. It will be useful to be able to demonstrate the degree of variation in this characteristic across Lankhills as a whole. Lankhills is one of very few sites with a large enough dataset to sustain general observations about whether objects were worn or placed in the grave.

3. The cemetery population

5.3.6 The analysis of the forms of individual graves and the influence of ‘important’ graves on the locations of subsequent burials around them may have implications for our understanding of aspects of the social structure of the community using this part of the cemetery. The placing of one grave within a small enclosure and the provision of stepped graves may be indicators of higher status, while the areas of more densely clustered graves may indicate a desire to place burials close to graves of significant individuals. The small group of north-south aligned graves, which appear to be late in the cemetery sequence, may represent the
burials of an intrusive social group or result from a break-down of the organisation of the cemetery associated with similar changes in society at large.

5.3.7 The potential of the data to address all of these aims will be further enhanced by comparison with the results of the 1967-1972 excavations.
6 ASSESSMENT OF FINDS

6.1 Pottery

By Paul Booth

Introduction

6.1.1 The three main phases of work produced a total of some 1994 sherds of pottery (40.845 kg) from 197 contexts (Table 3).

6.1.2 These figures include fragmented, mixed assemblages from a variety of contexts as well as complete and near complete vessels from funerary contexts, both cremations and inhumations. For the purposes of the assessment all the material was scanned very rapidly, but relatively detailed attention was paid to the more complete vessels because of their potential importance both for dating the graves with which they were associated and for shedding preliminary light on burial rites and customs in the cemetery. These vessels were recorded by sherd count and weight in terms of fabric and general form, and the date range as defined by the principal regional typologies was also noted. It is possible that the number of pottery vessels deposited as grave goods in inhumation burials (49 vessels are currently so identified) will change slightly in the course of more detailed analysis, but only a few vessels are likely to be affected. The understanding of vessels associated with cremation is more likely to be modified by further work.

6.1.3 In general this is a late Roman assemblage, as would be expected. The funerary material, in particular, is dominated by products of the New Forest industry. All the pottery associated with burials can be assigned to a broad date range from c AD 270 onwards, but it is quite likely that most vessels are of the 4th century. There is little indication that the material from non-funerary contexts was significantly different in date.

Cremation-related vessels

6.1.4 Some 55 vessels were identified as closely associated with burials, of which five were probable or certain cremation urns. Of the cremation vessels (467, 764, 999, 1007 and 1148) only one (1007) was substantially complete, albeit fragmented. A part of the rim of vessel 999 survived, but the other vessels were truncated and have no extant rim sherds. All were in a hard fired grog-tempered fabric of uncertain, but clearly regional, origin. Close dating of these vessels has not been attempted at present. It is notable that the general fabric type is not one usually encountered in the inhumation-related vessels.

Inhumation-related vessels

6.1.5 These vessels are discussed in terms of vessel count, regardless of whether or not a rim (normally the criterion for quantification by this measure) survives. Of the 50 vessels provisionally considered in this group, one (671) may have been
incidentally incorporated in the grave fill rather than deposited as a grave good and has not been considered in the discussion below. This vessel, unusually, was in an Alice Holt grey ware fabric. All but three of the remaining vessels were probable or certain New Forest products. The exceptions were a flanged dish (568) in a grog-tempered fabric similar to that used for the cremation urns, and two flasks (147 and 148) in an oxidised sandy fabric, almost certainly imports from the Trier region. These exactly parallel a vessel from Clarke’s excavation (Clarke 1979, fig. 69 no. 61) which at the time was thought to be unique in Britain. In addition to the two new examples from Lankhills two further examples of the form have been recorded from Colchester (Symonds and Wade 1999, 352 nos 116 and 117), from LWC (Lion Walk) A30 Gp 20 and BUC (Butt Road cemetery) C1467 Gp 18 respectively. The latter is from a double grave (grave 395/396) of W-E aligned inhumations in nailed timber coffins in a vault with plaster (Crummy and Crossan 1993, 112). This feature has some superficial resemblance to the arrangement of the step grave (Group 82) from which both the new Lankhills finds came.

6.1.6 The 46 probable New Forest vessels comprise 22 in colour-coated and 24 in reduced fabrics. The former include examples in both Fulford’s (1975) fabrics 1a and 1b, although in a few cases it was not possible to be certain which variant was used for complete vessels. Fabric 1b is normally oxidised orange-red or red-brown and associated with vessels with similarly oxidised surfaces, but this was not an invariable rule, since at least one vessel with dark colour-coated surfaces (normally associated with fabric 1a) was oxidised in the fracture. Without such damage it was not always possible to be certain which fabric variant was present. The reduced coarse ware fabrics were almost always very dark grey to black in surface colour (although they were not infrequently reddish-brown in the fracture). In some cases the surface colour was achieved with a black slip. No examples of such fabrics with partly white-slipped surfaces (observed in some instances in the assemblage from Clarke’s excavation) were noted.

6.1.7 The 49 vessels deposited as grave goods derive from 43 graves (ie c 13.5% of graves examined in this phase of excavation). Six graves (Groups 82, 575, 890, 965, 1205, 1225) each contained two pottery vessels. A small number of graves also include glass vessels, but no metal vessels were found, in contrast with Clarke’s excavation. The correlation of fabric with broad vessel class is shown in Table 4.

6.1.8 The pattern revealed here is similar to that seen in the rather larger assemblage of 91 vessels from Clarke’s excavations (Fulford 1979), summarised here as Table 5.

6.1.9 The OA excavations have slightly higher representations of flagons/jugs and jars, while Fulford's data show slightly higher levels of beakers and bowls. In the OA excavations the proportion of closed forms, flasks, flagons and jugs, amounts to just over 50% of all the vessels, indicating the highly selective nature of the funerary assemblage. Vessels associated with drinking (flasks, flagons, jugs and beakers) comprised 71.4% of the ceramic grave good assemblage from the OA excavations and 74.7% from Clarke's comparable material. In addition it is possible that some of the small jars from both assemblages also functioned as drinking vessels, thus emphasising the importance of this function still further.

6.1.10 The principal apparent difference between the Clarke and OA assemblages is in the identification of Oxfordshire products in the former. Fulford's report was prepared in 1973 (ibid., 221, fn3), at a time when the products of the Oxfordshire industry were not as well understood as they are now. The fact that no Oxfordshire products were identified amongst the grave goods from the OA excavation and, more importantly, that several of the vessels attributed to Oxfordshire by Fulford are of forms not otherwise recorded in the industry, suggest that he may have been over-optimistic in identifying Oxfordshire vessels. Nevertheless, the likelihood that at least some Oxford products were present in Clarke's assemblage is in contrast with the evidence from the recent excavations and is an aspect of the subtle differences between the two groups that will repay further investigation.

**Chronology**

6.1.11 Very few of the vessels from the 2000-2004 work have very closely-defined date ranges. Dating was based on that in the standard corpus of New Forest pottery (Fulford 1975). Most of the vessels recorded had date ranges from AD 270 (or later) onwards. A number of the reduced ware types could only be assigned a date in the period AD 270-400. Where closer dating was possible the most common ranges were AD 270-350 and AD 300-350 (for example for such common types as 20 and 30 in the reduced ware typology). Relatively few vessels were dated specifically to the middle part of the 4th century (eg colour-coated type 18, dated AD 320-370, from Grave 565 and type 71, dated AD 325-380, from Grave 1205) or to the second half of the 4th century (fine ware types 17 (dated AD 350-400+, from Grave 87), 22 (dated AD 340-400, from Graves 655 and 1400) and 57.2 (dated AD 330-400, from Grave 3008 in the watching brief area.). Of course some examples of types with a wide 4th century date range could belong to the later part of the century, and further work on refinement of ceramic and other chronologies will help to clarify this. At present the pottery dates present a picture consistent with that suggested by the more precise coin dating, and broadly support the view of a generalised chronological
progression of burial from west to east across the cemetery, as established by Clarke.

6.1.12 In five cases pottery vessels occur in coin-dated graves, two assigned (currently) to the early 4th century (1404 and 1619), one to the period c AD 350-365 (1442) and two to the period AD 388-402 (1372 and 1769). These last three graves are all in the north-west corner of the excavated area, which contains a notable cluster of late burials at least two of which (1372 and 1442) are aligned north-south. Inevitably, however, a fairly high proportion of the graves with pottery have no or few other artefactual or stratigraphic associations; in almost all of these cases the relevant vessels are dated AD 270-350 or AD 300-350.

6.1.13 Despite the presence of a number of New Forest vessels with date ranges beginning as early as c AD 270 there is no reason at present to suggest that the starting date for burial on the site should be moved earlier than the beginning of the 4th century. This assumption is consistent with Clarke’s dating of the southern part of the cemetery and with the other dating evidence from the recent excavations (there are, for example, no coin-dated graves of the late 3rd century). From a ceramic point of view, however, this remains an assumption to be tested, rather than a certainty.

Potential

6.1.14 The assemblage is important for two main reasons. It is of value for dating and therefore for refining understanding of the overall development of the site in the late Roman period, despite the fairly broad date ranges currently assigned to many of the vessels. This is on the basis that any dating is better than none and also that the broad chronological framework suggested by the pottery can be compared with that from Clarke’s excavation. Moreover, when the pottery is analysed more closely, in comparison and contrast with other dated objects and with the site sequence, it should be possible for refine some of the dating, with benefits for both the cemetery and other sites on which particular vessel types occur. The pottery is also of crucial significance for its contribution to understanding of the burial rites practised at the site, including the significance of the distinction between cremation and inhumation. The pottery also indicates the presence of occasional exotica, otherwise only suggested by the small finds.

6.2 Coins

By Paul Booth

6.2.1 A total of 70 Roman coins and 9 medieval and post-medieval coins and tokens was recovered. The coins were scanned quite rapidly. Identifications of the Roman coins were recorded where possible because of their importance for dating the site (Table 6). The condition of the coins was variable. Most require some cleaning to allow effective identification, a few are clearly worn and the occasional piece is damaged. In three cases pairs of (4th century) coins are still fused together and will require careful separation.

6.2.2 The Roman coins break down as follows:

<table>
<thead>
<tr>

</tr>
<tr>
<td>4th century</td>
<td>46</td>
</tr>
<tr>
<td>Uncertain</td>
<td>16</td>
</tr>
</tbody>
</table>

© Oxford Archaeological Unit 2006
6.2.3 Most if not all of the currently ‘uncertain’ coins are likely to be of 4th century date; for example, some are from grave groups known to contain other 4th century coins. Some 51 of the Roman coins came from 26 graves, including one from a cremation burial, although it has not been determined at this stage how many of these were deliberately deposited and how many incidentally incorporated in backfill. Five of the eight coins predating the 4th century were unstratified and two others came from grave fills. Both of these, however, were clearly associated with coins of later date. On this basis the coin evidence supports the suggestion that burial probably did not take place at Lankhills before the 4th century.

6.2.4 Some 58 Roman coins require some cleaning to allow identification. This work has been commissioned as part of the post-excavation assessment but it has not yet been possible for it to be carried out. After cleaning the coins have the potential to help refine understanding of the chronology of the cemetery and by detailed examination of their contexts to shed further light on practices of grave good deposition and the identification of chronological trends within these practices.

IN WINCHESTER

NICHOLAS PURDUE
Potential

6.2.5 Detailed identification and reporting of the coins is most important to provide absolute dates (of *terminus post quem* type) for the graves and other features in which they occur. Together with the coins from the earlier excavation they form a vital component in understanding the development of the cemetery as a whole. As grave goods the coins can be seen in combination with other artefact types as contributing to an understanding of the nature of burial rites at Lankhills. The combination of coins of disparate date in some grave groups (most particularly in Grave 1369) suggests that some of them may have a significance as objects rather than as money, and perhaps in this way prefigures the occurrence of Roman coins in Anglo-Saxon graves, for example at nearby Worthy Park (eg Hawkes and Grainger 2003, 67, for the occurrence of 1st-2nd century and late 3rd century coins in the same context)

6.3 Small finds

*By H E M Cool*

Factual Information

Introduction

6.3.1 This assessment is based on personal inspection of all the finds provided with a small finds number, except for coffin nails and hob nails, of which only a sample was examined, and excluding the small amount of material from the 2005 watching brief (4 copper alloy and 33 iron objects - 28 of the latter nails). The personal inspection was aided by X-radiographs for the copper alloy and silver items and for selected iron items. Items judged to be coffin nails and hobnails had not been X-radiographed at the time of the assessment. In addition material from approximately 58 samples was briefly scanned. As virtually all of this consists of iron fragments that have not been X-radiographed, the items were only noted if they appeared to be coffin nails or hobnails.

6.3.2 A simplified archive catalogue of the material was not produced. Instead the following was entered into an Access database: context, small find number (if assigned), sample number (if assigned) count, material, simple name, X-radiograph number, box number. The nails have additional information about the mineralised wood remains for use in the stratigraphic analysis (see section 6.3.6 below). The database has been supplied on a CD. It should be noted that the soil conditions appear to have been very corrosive; much of the material is in poor condition, and stabilisation and conservation will be needed in many cases before the items can be analysed. This is dealt with in section 6.3.32-33.

6.3.3 In the rest of this section, the finds are briefly reviewed according to their function within the burial ritual (coffin furniture, grave good etc). Section 6.3.30-31 reviews the finds found unstratified or in topsoil or buried soil contexts.

6.3.4 The site information used was that provided in February 2006. In what follows graves are referred to by their group numbers. No plans of individual graves were examined at this stage.
6.3.5 Coffin furniture

At least 220 graves had coffin nails (c 2900 nails are presently so identified). Coffin nails were examined from a sample of 46 burials with nails. This category of finds has suffered very badly (but most of the sample is from the 2000 excavation, the more recently excavated material is in better condition). They have been quantified by recognisable nail heads, though this may well be an underestimate in individual graves. A better quantification would need to take into consideration the grave plans which have not been examined during this assessment. The numbers recorded in particular graves ranged from 1 to 56 with a modal value of 15 and an interquartile range of 10 to 20. The graves with 25 or more were 58, 73, 82, 99 and 242-3. Most of the nails appeared to be flat headed nails of Manning (1985) Type 1, but there are also 3 graves where the large triangular-headed Manning (1985) Type 2 nails occur. These are indicative of a higher standard of joinery. Grave 158 only had this sort of nail. Graves 191 and 246 both had a single example amongst Type 1 nails, though in the case of 191 this was combined with an angle bracket.

6.3.6 Many of the nails preserved mineralised wood. Where sufficient is preserved to indicate the direction of the grain of the wood, this has been noted on the database (174 cases). This information can be used to reconstruct the joinery of the coffins if so desired. Substantial amounts of mineralised wood survive attached to nails in eleven graves (Graves 35, 41, 52, 58, 66, 82, 99, 233, 256, 272, 277). It may be possible to use this to identify the species of wood being used.

6.3.7 Other coffin furniture consists of iron coffin plates and angle brackets. Grave 1370 had 4 examples whilst graves 52, 150, 218 and 1250 had a single item each.

6.3.8 Grave goods: footwear

Hobnails are recorded from 89 graves and were examined from a sample of 18 of these. Groups of hobnails indicative of nailed shoes were found in 12 of these 18 graves (10, 35, 58, 73, 111, 120, 210, 233, 243, 272, 277, 291). In general the numbers recovered indicate very heavily nailed shoes. Currently the hobnails are generally preserved as singletons with occasional larger groups of two to five found corroded together. Generally it is unlikely to be possible to reconstruct nailing patterns, except where very detailed drawings were made. One grave (97) had 11 hobnails in total which might be indicative of lightly nailed shoes. Graves 66, 69, 218, 282 and 1015 each had either a single hobnail or in one case (282) four. These appear to be chance inclusions in the fill.

6.3.9 Seven graves had boot plates in them (665, 795, 810, 995, 1015, 1080 and 1140). Graves 995 and 1140 were exceptional in that they had 7 and 8 examples respectively. There are sometimes doubts as to whether such plates were parts of shoes, though during the earlier excavations they were found amongst the hobnails in six graves (Clarke 1979, 321). During these excavations the plates did not occur in any of the graves with hobnails. It will be of interest to consider the location of the plates in Graves 995 and 1140 as this might throw some light on how they were being used.

6.3.10 Grave goods: bracelets

Bracelets were found in 14 graves (see Table 7).

6.3.11 Most of the copper alloy and iron bracelets are common 4th century types, though there is one from grave 495 that is a most unusual hollow embossed type that might be an import from the Danubian provinces as such forms are commoner there.

6.3.12 Six of the graves had bone bracelets, but currently it is not possible to ascertain how many are in each grave as they are in very poor and fragmentated condition. During the analysis it may be possible to establish the numbers present by careful inspection and establishing how many terminals are present. In the earlier excavations at the site it was suggested that several bone bracelets were buried prior to AD 350 (Clarke 1979, 314). Elsewhere bone bracelets are more commonly found in late 4th to 5th century contexts (Cool 2000, 49). One of the recent graves producing bone bracelets (1370) also had two coins of the fourth decade of the 4th century, the other graves do not have any similar independent dating evidence. Until the fragments have been studied in detail to ascertain the types of terminals, they cannot be more closely dated than to the 4th century, but after study it is possible that they might provide a useful indication of late 4th century deposition.

Grave goods: brooches

6.3.13 Crossbow brooches were found in six graves (745, 843, 1075, 1846, 1923 and watching brief grave 3030, not examined). Those in the last four graves were complete. That from 843 was much fragmentated, and 745 lacks its foot. Of the complete ones, the gilded example from 1846 is of a type that would normally be placed in the mid 4th century, those from 1075 and 1923 would be placed slightly later. The examples in 1846 and 1075 both have the remains of mineralised textiles on the pin and backs of the brooch. That from 843 is most interesting as it came from a cremation burial, its fragmented state might be the result of being a pyre good. That will have to be ascertained during the analysis stage as it will require more detailed inspection than was possible during the assessment.
6.3.14 Grave 745 also had a copper alloy penannular brooch with an iron pin which again has mineralised textile remains. This brooch cannot be closely identified as the terminals are currently obscured and need to be cleaned.

*Grave-goods: necklaces and other bead strings*

6.3.15 Two of the graves (1355 and 1360) retained strings of beads threaded on copper alloy wire. That in 1355 is long enough to be a necklace. That in 1360 was described as a bracelet. There were also 24 other beads and an amber pendant from Grave 1360 which were likely to come from a separate ornament as they were not of the same type as those strung on the copper alloy wire. In addition three graves (110, 920 and 985) had sufficient beads to form a necklace or bracelet. Two had only a single bead (87 and 1235) and in these cases these may be inclusions in the fill and not a deliberate grave good. The beads in 985 included amber and crystal beads whilst those in 920 had amber and coral. Detailed analysis of the precise combinations seen in each set will be needed to refine the dates within the 4th century, but the presence of the amber beads in graves 920, 985 and 1360 would suggest that these belonged to the second half of the century.

*Grave goods: hair pins*

6.3.16 A most unusual open-work diamond and triangle faceted hair pin came from Grave 545 together with two shank lengths that may have come from another two pins. A similar shank fragment came from Grave 985. There were also slender iron shank or wire fragments from Graves 52 and 1355 which might also have been from pins of some sort.

*Grave goods: rings*

6.3.17 Nine graves produced rings which may be divided into ear rings, finger rings and rings of currently uncertain purpose (see Table 8). Of the finger rings only that from grave 1070 would have been of the sort to have an inset stone, all of the others are light trinket rings of late Roman date. The other rings probably served a variety of purposes. Two of the graves with them (745 and 1760) also had belt equipment (see 1.9) and so they might have been part of the belt fittings. It should be possible to assign them to a function at the analysis stage when the grave plans are examined.

Grave goods: belt fittings

6.3.18 Items of belt equipment were found in 11 graves (see Table 9). The material from grave 1846 was of silver, the buckles in 1694 and 1760 were of iron, the remaining items were of copper alloy.

*object not seen

6.3.19 The commonest type of buckle and plate was the Simpson (1976) Group I with B-shaped frame and oval plate. These were found in Graves 1846, 1921 and 1925. Grave 1921 also possessed an example of a Simpson (1976) Group IV with a rectangular buckle frame and plate. The strap ends associated with these buckles are normally either amphora-shaped or heart-shaped (ibid 198-200). Only in the case of 1846 were both the buckle and strap end found in the same grave, though strap-ends of this sort were placed in Graves 745 and 1075. The buckles and plates in Graves 400 and 1175 belonged to Hawkes and Dunning (1961) Types 1a and 1b respectively. All of these items would suggest deposition in the later 4th century and into the 5th century. The buckle from Grave 303 was of Simpson (1976) Group II with an oval frame and plate.

6.3.20 The belt plate in 1180 is an unusual form that will need investigative conservation. The cruciform silver buckle pin in 1355 is also unusual. In the absence of any part of the frame or buckle plate, it should probably be viewed as a pendant, especially as it comes from a grave that also produced a bead string. Whilst it would be tempting to see it as having been selected because of its cruciform shape and thus to be a religious symbol, this temptation should probably be resisted. This cross-shape was not a Christian symbol in the 4th century because at that time the monogram cross form was preferred.

Grave goods: combs

6.3.21 The remains of bone combs in very poor condition were found in four graves (784, 1074, 1198, 1204). This is an artefact type that comes into use during the later 4th century.
Grave goods: knives

6.3.22  Knives were found in six graves (930, 1175, 1310, 1760, 1805, 1921). That in 1760 was relatively short and is possible best regarded as a domestic knife and a similar function would probably be best for the broken fragment in 930. The others, however, are of a size and blade shape such that they should probably be regarded as daggers. This identification is further suggested by the silver handle fittings on that in 1805 and the integral hilt pommel on that in 1175.

Grave goods: spurs

6.3.23  A pair of copper alloy spurs were found in Grave 1846. Typologically they are unusual but have some similarities with the later 4th century form with bird-headed decoration above the prick (Leahy 1996). These are a most remarkable find as they are, as far as I am aware, the first pair of spurs to have been found in a Roman grave in Britain.

Grave goods: shears

6.3.24  A pair of iron shears were found in Grave 730. Again such items have rarely been found in Roman graves in Britain.

Grave goods: vessels

6.3.25  Three graves contained complete, or substantially complete, clay vessels of the 4th century. Grave 1440 had a large hemispherical cup and 1373 had a slender beaker with a fire-rounded rim which indicates it belongs to the later part of the century. The small jug with a spout on the body from grave 1760 is a most unusual find. No 4th century examples have been found previously in Britain, and examples of that date are rare everywhere.

6.3.26  A substantial part of the lower body of a globular vessel in the typical glass of the 4th century was found in the fill of cremation burial pit 843. It shows no sign of burning so was not a pyre good. It may be the remains of a deliberately deposited vessel, but this can only be decided after consideration of the depositional processes in the pit.

6.3.27  Fourth century glass body fragments were also found in the fills of graves 87, 272 and 700 but these are likely to be chance inclusions.

Grave goods: miscellaneous

6.3.28  A number of finds that fall into none of the preceding categories are noted here. All came from grave fills but as many are fragmentary it is unclear at present whether they were chance inclusions or deliberate grave goods. Inspection of their position in the grave may clarify this matter.

6.3.29  Two fragments of bone inlay of the sort used to decorate boxes came from grave 620 and 1610. The former is of particular interest as it retains part of an inscription, unfortunately incomplete, which reads DIVV[. The most likely reconstruction of this is DIV VIVAS - 'may you live long'. It is possible, but perhaps unlikely, that it has Christian significance. The function of a set of bone plates fastened with iron rivets from grave 530 is currently unknown. There is a
small iron hook from Grave 129 and a lead rod from grave 930. An iron object from grave 710 will need investigative conservation before it can be identified.

*Items of interest from the topsoil, buried soil horizons etc*

6.3.30 Virtually all of the material from these contexts is of relatively recent date. Items of certain Roman date are the 4th century bracelet fragment sf522 and a small number of hobnails (sf 160, 446, 523, 534 and 745). Sf 745 also included coffin nails with mineralised wood.

6.3.31 Two items indicate activity on the site in the medieval period. There is a folding strap clasp of the late 13th to early 14th centuries (sf1 88) and a buckle and plate of a type in use during late 12th to late 14th centuries (sf1 450).

*Condition*

6.3.32 A remarkable feature of the material from the 2000-5 excavations at Lankhills is that much is in very poor condition. This includes the bone items even though they could be anticipated to survive well on chalk, and the vessel glass which is normally very stable in northern European burial environments. The iron is in a particularly perilous condition with ongoing fragmentation. It is most unfortunate that the nails and coffin fittings were not X-radiographed immediately after excavation as it may now be too late to establish their sizes and little further work will be possible on them.

6.3.33 The copper alloy will need quite extensive conservation to clarify obscure details and in some cases to stabilise the items so that they can be handled during the analysis stage. The conservation needs are itemised in Appendix Table 2.

*The potential*

6.3.34 The potential is best considered against a summary of what has been found which is presented in Table 10 according to the principal categories described in 6.3.5-6.3.28. The contents of the table ordered by grave number forms Appendix Table 3.

*Dating*

6.3.35 The small finds and glass vessels will be very helpful in establishing the chronology of the cemetery and its development. As will be apparent from sections 6.3.10-27, many items can be independently dated to the 4th century and some to the later parts of the century and into the 5th century. The presence of this late material has been indicated in Table 10 by asterisks. The contribution that this material will make can be understood when it is appreciated that there is very little overlap with any other independently dateable items. Only graves 18, 82, 87 and 291 also have pottery and only 1175 and 1370 also have coins.

© Oxford Archaeological Unit 2006
(Abbreviations: + = present, ? identification or identification as grave good insecure, Foot = footwear (sample only), Brac = bracelets, other orn = ear rings, ringer rings, hair pins, Vess = glass vessels). Burials 129, 530, 620, 710 and 1610 also produced items that may be grave goods that are not considered here (see 6.3.28).

Funeral ritual

6.3.36 As can be seen from Table 10, the grave goods have been deposited in a very structured way. People with footwear often did not have any other type of grave good and when they did these were almost exclusively items of personal adornment. There is a very clear distinction between people buried with jewellery and people buried with belt fittings and cross bow brooches etc. The fact that there is little overlap between the graves with coins and pottery and the graves with the sort of finds considered here strengthens this impression of structure. This continues patterns seen in the earlier excavations where people appeared to be buried with age and sex specific goods. Given the numbers of jewellery items it might be expected that 920, 985 and 1360 might well be young girls (Gowlan 2001, 160) whilst 745, 1075 and 1846 are most probably adult males. Once the osteological information is available, this data set and the data from the earlier excavations will provide valuable insights into how the community (or communities) that buried their dead here regarded the different ages and sexes.

Immigrant and native communities

6.3.37 One of the most noteworthy suggestions that came out of the earlier excavations was that a later 4th century immigrant community could be detected within the people buried at Lankhills. This depended very much on the way in which the grave goods were placed in the grave, whether the ornaments were worn or unworn etc. It will be possible to explore this further for these graves when the grave plans are examined in detail, as the same types of objects used in the original analysis are present in the 2000-5 graves. It is possible that some of the unusual objects noted above (eg the hollow bracelet in Grave 495, section 6.3.11) might also provide some evidence to help explore this aspect of the community.

Contribution to finds studies

6.3.38 The publication of this assemblage will be of great benefit to finds studies. Though many items are very similar to those found earlier, there are also some unusual items that were not found in Clarke’s excavation and appear to be very rare generally. The individual buried in 1846, for instance, had silver belt equipment and a pair of spurs both of which are unique in Britain and rare.
elsewhere in the empire. The glass jug in 1760 is also unique. Given the number of very late items, the assemblage will also contribute to our understanding of what was in use during the late 4th century and into the 5th century.

6.4 Worked flint

By Kate Cramp

Introduction

6.4.1 A total of 113 struck flints and 15 pieces (309 g) of burnt unworked flint were recovered from the excavation (Tables 11 and 12). The flint is largely undatable, with the exception of an early Bronze Age backed knife from context 265. A number of the blades may be Mesolithic or early Neolithic in date. The flints were thinly spread across the site, usually occurring as single finds in a context; no deposit contained more than four pieces.

Condition

6.4.2 The flintwork is in variable condition. Several pieces are exceptionally fresh, suggesting that some of the material has been minimally disturbed; others are rolled and damaged, and have clearly been redeposited. Most flints display some curation, which ranges from a light incipient speckling to a dense white discoloration. Calcium carbonate concretion is present on several pieces.
**Raw material**

6.4.3 The raw material represented is a good quality chalk flint, probably from the South Downs, with a thick (>10 mm) unweathered cortex. The burnt unworked flint probably originates from the same source.

**The assemblage**

6.4.4 The assemblage is dominated by flakes (45 pieces) and chips (48 pieces). Blades, bladelets and bladelike flakes are also present in small quantities. Some of these (e.g. from contexts 1, 68 and 1582) are soft-hammer products, with platform edge abrasion and dorsal blade scars, and may belong to a Mesolithic or perhaps early Neolithic industry. The majority of removals are, however, chronologically undiagnostic.

6.4.5 Three retouched pieces, including one backed knife (context 4) of probable early Bronze Age date, were recovered from the site. The retouched flake (context 195) and notched piece (context 265) both have inverse retouch to the bulbar end; in the case of the notched piece, this creates a shallow, concave edge. Neither piece can be closely dated.

**Recommendations**

6.4.6 Given its small size and its largely residual status, no further work is recommended on the assemblage itself. A publication text should be prepared, using archive data and this assessment report as a basis.

6.5 **Ceramic Building Materials**

*By Cynthia Poole*

6.5.1 Ceramic and stone building materials totalling 197 fragments weighing 19853 g were recovered from the excavations. The material has been rapidly scanned, including a preliminary assessment of fabrics using a binocular microscope at x25 magnification. A summary of the information recorded appears in Appendix Table 4 at the end of this report.

**Fabrics**

6.5.2 Broad categories of fabrics were established for the Roman materials using the coding established for the Danebury Environs Project by the author, but not yet tied into the Winchester type series. No fabrics of later material were characterised.

- Fabric C: defined by medium-coarse sand content. Subcategories were assigned for very high densities of coarse sand C(fs) and frequent sand sized red pellets of iron oxide or iron rich clay C(fe).
- Fabric C2: laminated sandy clay with large quantities of buff and/or red clay/silt pellets.
- Fabric D: fine sandy clay.

6.5.3 The variety of fabrics is relatively limited, suggesting that the tile was being sourced from a small number of tileeries.
Forms

Post-medieval

6.5.4 Nearly a third of the recovered material was of 18th-20th century date and has only been summarily recorded. It was noted that much of the material was brick, including one in a distinctive yellow colour with a shallow frog. In addition there were fragments of ceramic and stone floor tiles, roof tiles and pantiles. This material most likely derives from the construction or alterations to Lankhills House.

Roman

6.5.5 The Roman building materials amounted to 112 fragments weighing 14,392 g. The majority of this was ceramic apart from three pieces of Purbeck limestone slabs, which are probably from the lower ends of polygonal roof slating. Abrasion of fragments was generally low or moderate and a number of large pieces of ceramic tile were present, including two complete imbrices from the same grave (context 258). The variety identifiable types is very low, comprising tegulae and imbrices. The remainder is classified as unidentified or flat, most of which was of a similar thickness to the tegulae and imbrices and is likely to derive the same forms.

6.5.6 A small number of pieces had markings on the surface. These were: a signature mark in the form of an S-shaped finger groove, an incised cross X which may be a signature or a tally mark, and two pieces with combing, one band across the lower end of the one of the complete imbrices and an example of very wide-toothed combing on an unidentified fragment.

6.5.7 The notable features of this collection of tile are the high proportion of imbrices, which account for approximately two thirds of the Roman ceramic building material, and the complete absence of non-roofing material. The proportion of imbrices to tegulae is not that normally found where tile can be related to buildings. There is a distinct contrast between the cemetery and areas of habitation. Brodribb (1986, 21-22) records the use of both tegulae and imbrices in the construction of graves. At the eastern cemetery of Roman London (Barber and Bowsher 2000) there is some evidence that tile may have been used as grave markers. The presence of sooting on some fragments may indicate that some tile was associated with the cremation rites in some way.

Statement of potential

6.5.8 The Roman building material data should be recorded onto a database. It will be necessary to re-examine some of the more complete pieces and those with
unusual features, but for most of the smaller fragments data need only be transferred from the paper copy. The pieces with unusual markings should be drawn. As part of the recording process the fabrics should be tied in to the Winchester fabric type series for ceramic building material.

6.5.9 Analysis of the tile should examine the relationship of the tile to the graves to establish whether the unusual character of the assemblage relates to construction or marking of the graves. The material is clearly reused, having originally served as roofing on the basis of the pattern of mortar adhering to some tiles. It will be worth considering whether there is any evidence for funerary structures that may have had tiled roofs and whether any such structures could have been exclusively roofed with imbrices in the Laconian system of roofing.

6.5.10 It is not recommended that any further work should be done on the post medieval-modern building material.
7

**ASSESSMENT OF HUMAN REMAINS**

*By Sharon Clough and Louise Loe*

7.1

**Introduction**

7.1.1 The skeletal material recovered from Lankhills comprised a total of 288 individuals from 340 burial contexts and 26 cremation burials. Osteological data collected on site were collated for this report. This is intended to give a preliminary ‘broad-brush’ overview of the total assemblage excavated by OA.

1.1.1 Formal osteological assessment was also undertaken on six sub-samples of the assemblage, selected as representative of the entire excavated assemblage. This material spans, in date, all phases of burial activity and derives from all areas of the site. It comprises 49 unburnt skeletons and 10 cremation burials (20% of the total skeletal population) and includes burials that were in deposits overlying ditches, were clustered around earlier pit features or were aligned north-south (for location see Fig. 7).

7.1.2 Bone preservation varied considerably across the site and within the assessment groups. There was a high proportion of adults (particularly in the mature to older age group), with an under-representation of subadults. There were slightly more males than females. The pathologies observed on the skeletal material were consistent with an older population.

7.2

**Overview of the total assemblage**

*Unburnt Skeletons*

**Methodology**

7.2.1 The skeletons were assessed on site by an experienced osteoarchaeologist (ie a member of OA’s osteoarchaeology team) for skeletal completeness and condition of the bone, as well as biological age and sex. This information was collated from the paper records and forms the basis for quantification of the total assemblage. These results must be viewed as preliminary, as there is considerably less accuracy in ageing and sexing skeletons whilst they are still *in situ*. Bone condition and skeletal completeness may also differ between the excavation and the post-exavcation stages due to the effects of excavation, processing and transportation.

7.2.2 The preservation status of each skeleton was assessed based on the overall condition of the outer cortical bone and the cancellous bone, and the degree of fragmentation of individual elements. The following scores were assigned:

1 = Poor (cortical bone completely eroded, cancellous bone small and infrequent and extremely fragmented)

2 = Fair (some cortical bone, though eroded in places, cancellous bone present and frequent fragmentation)

3 = Good (complete cortical bone with occasional damage, cancellous bone complete and occasional fragmentation)
4 = Excellent (cortical bone undamaged, cancellous bone complete and rare fragmentation)

The amount of the skeleton present was recorded as a percentage and, based on this, skeletons were assigned to one of the following categories:

1 = <25% complete
2 = 25-50% complete
3 = 50-75% complete
4 = >75% complete

Completeness did not have any bearing on the condition of the skeleton. In other words, a skeleton could be in a good condition but be less than 25% complete.

Biological age and sex were estimated by employing standard methods, where appropriate (Brickley and McKinley 2004). Skeletons for which sex could be estimated with relative accuracy were recorded as definite male or definite female. Skeletons that had ambiguous features, or insufficient features surviving, were recorded as possible male or possible female. Individuals who had no diagnostic features available were recorded as of unknown sex.

The age categories used for this analysis were:

Neonate - 36 weeks-1 month
Infant 1.1 month-2 years
Young child - 2.1-5 years
Older child - 5.1-12 years
Adolescent - 13-17 years
Young adult - 18-25 years
Prime adult - 26-35 years
Mature adult - 36-45 years
Older adult - 46+ years.

These categories were also used in re-analysis of the skeletons excavated by Clarke in 1967-72 (Gowland 2001). This consistency will facilitate comparisons between, and possible integration of, the osteological data sets from the two phases of excavation at Lankhills.
Results

Number of Skeletons

7.2.3 The successive phases of excavation undertaken by OA revealed 340 graves of which 18 remained unexcavated. There were a further 30 excavated graves that contained no visible human bone. In four other graves, bone was observed but was too fragmentary to allow further analysis. The number of skeletons available for analysis was therefore 288 (Table 14).

Table 14. Summary of the number of skeletons

<th>Graves containing adequately preserved human bone</th>
</tr>
</thead>
<tbody>
<tr>
<td>340</td>
<td>322</td>
<td>292</td>
<td>288</td>
</tr>
</tbody>
</table>

7.2.4 The majority of inhumations were single interments. However, four graves contained two individuals in each (graves 445, 620, 1351 and 1790).

Skeletal preservation and completeness

7.2.5 Preservation was very variable across the site, and often differed considerably even between adjacent graves. Overall, bone preservation was 'excellent' to 'good' in 39.5% of the population, and 'fair' in 19.4%. The preservation of 40.97% of the population was scored as 'poor' (Fig. 10 below).

7.2.6 Completeness of the skeleton was likewise variable, with skeletal elements missing due to truncation and to chemical destruction of the bony tissue. Skeletal completeness was estimated to be >75% in 32.2% of the total population, whilst 20.4% were estimated to be 75-50% complete, and 18.4%, 50-25% complete. Approximately 28.8% of the skeletons were less than 25% complete, in some cases represented by only small fragments of bone.

Figure 10: Preservation and completeness of the total assemblage (N=288)
7.2.7 Demographic Profile

7.2.8 The assemblage comprised 222 adults and 66 subadults (of a total of 288). Of the adults, 122 could be sexed and 100 could not. Of the former, 43 were female and 79 were male.

![Histogram showing age distribution](image1)

*Figure 8: Age distribution of the total assemblage (N=288)*

7.2.9 All age categories were represented in the population. It was possible to estimate the age of all 288 skeletons, albeit assigning some skeletons to a very broad age range (Fig. 8). There were more individuals in the 35+ years age categories than in the prime or young adult age categories (18-35 years). These preliminary results show there were more males in the upper age ranges and more females in the lower age ranges (Fig.9). There were 83 individuals identified only as ‘adult’ (>18 years) and 14 as ‘subadult’ (<18 years). As expected, the older child and adolescent categories were poorly represented. There were also low numbers of infants and young children, an under-representation of the usual proportion of the population expected for a pre-industrial assemblage (Chamberlain 2000, 106).

![Histogram showing age and sex distribution](image2)

*Figure 9: Age and sex distribution (N=122)*
Cremated remains

Cremated human bone was present in 26 contexts. Most of these were a single deposit deliberately placed within a grave. These were interpreted as cremation burials. Several such deposits were each contained within an urn.

Methodology

7.2.10 In accordance with recommended practice (McKinley and Roberts 1993), cinerary urns were lifted largely intact and the contents of cremated bone were excavated under controlled laboratory conditions. These deposits were excavated in 2 cm spits, each of which was planned at a scale of 1:10, and a total soil sample taken.

7.2.11 Unburned deposits (excavated as described above, Section 3.1.9) and urned deposits were wet sieved and sorted into >10mm, >5mm and >2mm size categories. The sorted bone and the residues were then assessed.

7.2.12 The material was rapidly scanned to note colour type and variation and level of fragmentation. Fragmentation was assessed visually by estimating the percentage of fragments that were assigned to the >10mm and >5mm size categories. Residues were assessed to estimate the amount cremated bone present. Ten contexts were selected for more detailed assessment, and are discussed more fully in section 7.3.23.

Results

7.2.13 Bone fragmentation was not marked: most bone fell into the >5 mm size category. Colour varied from buff white to brown, which suggests the full range of temperatures attained during the burning event. The residues from the smaller size categories were found to contain minimal quantities of cremated bone.

Discussion

7.2.14 The cemetery population represents a cross-section of the late Roman population of Winchester, ranging from neonates to older adults, and including males and females. Although some trends are broadly apparent (e.g. more males than females, especially in the upper age range, and an under-representation of infants and young children), these findings are tentative in advance of formal analysis. So too is the on-site assessment of skeletal preservation and completeness which indicates considerable variation within the assemblage and suggests that the osteological potential of approximately 25% of the total assemblage is limited because of these factors. Nevertheless, there remains considerable potential for further detailed osteological analysis of a large proportion of the assemblage.

7.2.15 The large fragment size and good preservation of the cremated remains also indicate the considerable potential of these burials for detailed osteological analysis.
7.3 The sample

Sampling strategy

7.3.1 In order to assess the skeletons across the whole site, six areas were targeted. These have been recorded as sub-samples 1 to 6 and include 49 unburnt skeletons and ten cremation burials.

Methodology

7.3.2 The inhumations were examined in accordance with British guidelines for assessing human remains (Mays et al. 2002), in order to establish potential for further analysis. Assessment of preservation and completeness and estimation of biological age and sex were undertaken. Any skeletal pathology that was observed during assessment was noted but this was not formally analysed or recorded.

7.3.3 Skeletal preservation and completeness were assessed by employing the methodology described above (Section 7.2.1).

7.3.4 Sex was assigned on the basis of sexually dimorphic differences observed on the skull and pelvis (Schwartz 1995, 276; Ferembach 1980, 517-49). Skeletons were recorded as male, female, possible male, possible, female or unknown, as described above (7.2.2). Age estimation of the adults was based on cranial suture closure (Meindl and Lovejoy 1985) and auricular surface degenerative changes (Lovejoy et al 1985). Tooth wear analysis was not used, as it soon became apparent that it markedly under-aged the skeletons. The age of subadults was approximated by observing the stage of the formation and eruption of teeth (Moores et al. 1963a), epiphyseal union (Schwartz 1995) and by employing the measurements of diaphyseal lengths of long limb bones as described by Scheuer et al. (1980). Based on these observations, each skeleton was assigned to one of the age categories presented in section 7.2.2.

7.3.5 The skeletons were also assessed for their potential to yield metrical data, in particular stature estimation. Stature may be estimated from human skeletal remains by applying the maximum length of complete long limb bones to regression equations. For the present analysis, complete long limb bones were measured using an osteometric board to the nearest millimeter. These measurements were then applied to the regression equations devised by Trotter and Gleser as modified by Trotter (Trotter 1970). Different equations apply to males and females, therefore skeletons for which sex could not be estimated were excluded from this analysis. However, to maximise the results, all possible males and all possible females were included.

7.3.6 Other observations involved noting which skeletons had sufficiently preserved crania for metrical assessment which will allow ancestry to be explored (Gill 1998).

7.3.7 Non-metrical data was noted but not formally scored. Non-metric traits are morphological variations in the skeleton. Such traits are influenced by both the environment and genetics, but to variable and unpredictable degrees (Saunders 1989). For example, cranial traits are believed to be under greater genetic control, while some post-cranial traits, such as the third trochanter on the femur, may develop as a result of occupational stress (Brothwell 1981).
7.3.8 The cremated bone from the >5 mm size category was weighed and the colour and level of fragmentation noted, as described above.

Skeletal preservation and completeness

7.3.9 Of the 49 individuals, 32 (64%) were more than 50% complete and 35 (70%) were in good to excellent condition (Table 15). This has significant implications for the osteological potential of the population of Lankhills, as it is higher than that recorded in the field (see section 7.2.6 above). Five of the skeletons were less than 25% complete, but were in excellent condition and will therefore still contribute to the data set.

Demographic Profile

7.3.10 The mortality profile indicates that there were more older and mature adults than any other age group (Fig. 11). This profile is similar to that observed in modern developed populations, where there are few infants and children and most individuals live to 45 years and above. This is not the expected mortality curve of a pre-industrial population which is characterised by a peak of mortality in the infant and young child age groups with a gradual decline across all other ages and few adults surviving beyond 45 years (Chamberlain 2000). However, other factors, such as burial ritual, preservation and excavation strategies may explain this pattern. For example, it may be that subadults were buried elsewhere in the cemetery or beyond.
7.3.11 Preliminary assessment of the sex of the adults (40 individuals) is summarised in Fig. 12. This shows that there are more males than females (44% to 38%).

Figure 12: Proportion of males, females, and unsexed skeletons (N=40)
7.3.12 The age and sex distribution of the sample (Fig. 13) shows that more males than females lived to an age greater than 45 years and more females than males died at younger ages. In modern populations women tend to outlive men, but factors such as childbirth or cultural practices (such as preferential treatment of males over females in terms of food and other resources) may have contributed to an earlier age at death in females.

![Age and sex distribution of the sample](image)

**Figure 13: Age and sex distribution of the sample (N=49)**

**Metric analysis**

7.3.13 It was possible to estimate the stature of 30 skeletons. Although it is not the aim of the present analysis to explore the calculated statures in any great detail, it was noted that at least two individuals were over 1.8 metres tall (6 foot). Other osteological measurements of the long bones and crania were also possible. This confirms that preservation of the collection is not only sufficient as to allow stature estimation, but also other detailedmetrical analyses. This includes analyses that may facilitate the estimation of biological sex and allow ancestry to be explored.

**Non-metric traits**

7.3.14 Two instances of retention of the metopic suture into adulthood and two of third molar emergence with a single root were observed in the assessed sample. These traits have a high instance of inheritance and may be useful in suggesting familial links between individuals buried within the cemetery.

**Skeletal pathology**

7.3.15 Most pathology was associated with the degeneration of the joint surfaces. Fractures were well healed and aligned, and there was a low level of cribra orbitalia, a condition caused by iron deficiency anaemia. One particularly interesting and unusual pathology observed was premature cranial suture closure (scaphocephaly). There was also a case of auditory torus (small bony growths in the ear, which may cause deafness). These two conditions may have been apparent to the community in which they lived.
7.3.16 Among the dental conditions noted were caries, calculus, antemortem tooth loss, periodontal disease and enamel hypoplasia. There were low prevalences of both calculus and caries. Dental attrition was much lower than expected and appeared to have little correlation with other age-related changes. This may reflect a reduced coarseness of the diet, possibly reflecting changing food processing patterns in this urban population.

Assessment of skeletal sub-samples

Sub-sample 1

7.3.17 This sample comprised 11 skeletons in 13 graves. The preservation and completeness of the skeletons varied considerably. Seven skeletons were in good or excellent condition and 50% or above complete. Of these, two in particular (grave groups 82 and 23) were in excellent condition and nearly complete. An extra foot found in grave group 855 might have been interred originally with the 'empty' grave 844, which has been truncated by 855.

7.3.18 The skeletons were all adult, with the majority in the mature or older adult age categories. Among the pathological conditions observed in this sample were diffuse idiopathic skeletal hyperostosis (DISH) and osteophytosis of the vertebrae. These conditions are common among older individuals and DISH is frequent among skeletal populations associated with high status sites (Rogers and Waldron 1995; 2001). There were also healed fractures and enthesophytes (new bone formation at sites where tendons, ligaments and articular capsules insert into bone). Enthesophytes may accompany other disease processes (for example, DISH), or they may occur independently in relation to musculoskeletal stress. Grave group 884, a prime adult (25-35 years) male had an auditory torus in both auditory meati (ear holes). This may have caused deafness. These exostoses are thought to form due to repeated exposure to cold water (Roberts and Manchester 2005, 150-1). A study undertaken by Okumura et al. (2005) has identified an association between this condition, biological sex and distance from coastal environment. It may also relate to social status. For example, high status Roman males who frequented baths, which include a cold room or frigidarium, were found to have a high incidence of these exostoses (Manzi et al. 1991). A child from Poundbury with this condition had been buried prone (Roberts and Cox 2003, 115) and it is possible that this disability underlay this non-normative treatment of the body in death.

Sub-sample 2

7.3.19 This group comprised 20 graves and 16 skeletons. Of these, four were subadult, two were prime adult, 8 were mature or older adults and two could only be identified as adult. Four males and an equal number of females were identified. The bone preservation varied between graves, and does not appear to be associated with biological sex. Subadults were less well preserved, probably due to the more fragile nature of their bones. However, five adults were 50% or less complete and their bones were in a poor or fair condition. The remainder were well preserved and were largely complete.

7.3.20 Spatially, there was a cluster of subadults, with three positioned adjacent to one another in a row, which was north-south. This may suggest zoning by age, and the possibility that this was more widely practised may provide a reason for the low number of subadults found during excavation (see section 7.2.9 above).
7.3.21 Skeletal pathology includes degeneration of the spine and other joints and enthesophytes. The former may be age- and/or activity related.

7.3.22 Retention of the metopic suture (metopism) was observed in two individuals in this group, both older adult males (grave group 1515 and 1884). They were both positioned on their sides, west-east in orientation and the graves were in the same row (close to one another). It is possible that the two individuals were biologically related due to sharing this heritable trait. Their proximity to one another within the cemetery and the fact that they share similar body positions lend support to this suggestion. Skeleton 1517 (grave group 1515) was a decapitation burial. There was clear evidence of cut marks on the cervical vertebrae. These will be osteologically examined in more detail during the full analysis stage.

Sub-sample 3

7.3.23 This sample comprised eight skeletons in eight grave cuts. There were also three unurned cremations, three urned cremations and three in situ cremation burials.

7.3.24 The inhumations in this group comprised six adults and two subadults. Of the former, three females and two males were identified. Preservation and completeness scores were higher than other groups. There was only one individual (grave group 625) who scored poorly for both.

7.3.25 The prone older adult female (grave group 665) displayed pathology typical of adults of this age group. The left and right knee joints showed changes that were consistent with a diagnosis of osteoarthritis. She also had spondylosis involving the 5th lumbar vertebra. All her teeth had been lost ante mortem, the tooth sockets all having remodelled before her death.

7.3.26 The subadult of around eight years old in grave group 1070 had premature fusion of the sagittal suture (scaphocephaly), which may have resulted in a ‘heel shaped’ skull. Although this condition may not have impaired brain function, it would have been noticeable to an observer. It is worth noting that this individual was buried prone. It is possible that this treatment in death was a social response to a physical anomaly during life.

7.3.27 The weight of bone derived from an adult cremation from modern crematoria varies from about 1000-3600 g (McKinley 2000, 404). The Lankhills cremation burials (in general) had very high weights and large fragment sizes. These are summarised in Appendix Table 8. The highest weights came from the in situ cremation burials, the highest weight being 1636g (grave group 655). This may suggest that the cremated remains of 655 were carefully collected. The fragment size was large (70 x 50 mm), with whole, complete bones present. Therefore, it should be possible to estimate both age and sex and perhaps to identify pathology from this cremation burial. The colour of the cremated bone reflects the temperatures achieved during the burning of the pyre which can suggest aspects of pyre technology. It varied from buff white to brown, which suggests that some parts of the body were better cremated than others and that an optimum temperature of > 600°C was not achieved, or was not sustained for a long period (ibid). The lowest weight came from a possible cremation pit (grave group 1065) which was heavily truncated and has therefore much lower potential for further analysis. Grave group 1160 contained predominantly animal bone, which was fragmentary.
7.3.28 As the cremation burials were in good condition, they present great potential to yield valuable information about age, sex, pathology and pyre technology.

Sub-sample 4

7.3.29 This is a group of five graves, containing five west-east orientated skeletons, that truncated ditch group 1420. They were all adult skeletons, two being female, two male and one unidentified. They were all in the mature or older adult age categories. All five were well or excellently preserved (grade 3 or 4), with three more than 75% complete, one 50-75% and grave group 1324 represented by the lower legs only.

7.3.30 These individuals display evidence for age-related joint degeneration, as well as injuries sustained during life. In two individuals (grave groups 590 and 1375), the crown of third molar was reduced in size and had a single root. Presence or absence of the third molar is under a degree of genetic control (Hillson 2005, 113). It is possible that these two individuals, both older adult males, were biologically related as they share this non-metric trait.

Sub-sample 5

7.3.31 This group comprised three adults and three subadults in individual graves, which truncate ditch 450. The adults were all male and within the mature or older adult age category. The subadults consisted of two adolescents (14-16 years and 12-19 years) and a child aged 3-4 years.

7.3.32 These skeletons were all more than 75% complete and were well (Grade 3 or 4) to excellently preserved. This high level of preservation will enable detailed osteological analysis.

7.3.33 A particularly notable individual is grave group 1638, an older adult male. This male was powerfully built and exceptionally tall at around 1.88 m (6ft 2in). Severe calculus was observed on the right mandibular premolars and molars. There was no calculus on the left side, or indeed any of the other teeth. Among, the differential diagnoses for this is facial paralysis or hemiplegia, possibly as a result of a stroke or Bell’s Palsy (paralysis of the facial nerve). Individuals with this condition show marked drooping of the eyelid, cheeks and mouth on the affected side, and may experience difficulty in speaking and masticating (bellspalsy.org). Lack of movement of food around this side of the mouth would lead to a build up of calculus. The present skeleton was buried in a deep grave (>1.8 m below bedrock) in a wooden coffin constructed using very large nails. He was buried holding copper alloy coins in his left hand, the dates of which suggest a terminus post quem of at least AD 364.

Sub-sample 6

7.3.34 This comprised four skeletons in four graves. These were three adults and one infant (0-6 months). Grave group 282 was an older individual (45+ years), probably female, in excellent condition and nearly complete. This skeleton had osteophytes on the 5th lumbar and 1st sacral vertebrae. She also had eburnation on the 1st metacarpal and articulating carpal (trapezium) of the left hand.
7.3.35  The preservation of the infant (6) was also excellent. This is unusual given the thinner and more fragile nature of infant bones, which decay more easily (Mays 1998, 21).

7.3.36  The sample as a whole was excellently preserved (except grave group 73, whose preservation was rated as fair) and had more than 50% (and mostly >75%) of their bones present. Grave group 242 had her lower legs removed during Clarke's excavations.

Discussion

7.3.37  Bone preservation varied considerably between the sub-samples. Sub-samples 1 and 2 had the most variable preservation with the most poorly preserved skeletons. The best preserved were sub-samples 4, 5 and 6. Sub-sample 3 had the most intercutting graves, which affected the level of completeness. The skeletons in this group were, however, generally well preserved.

7.3.38  Neither the age (with the exception of infants), sex, nor the location of the grave within the cemetery, appeared to influence bone preservation. Burial environment affects the preservation of bone. Much work has been done to explain the differential survival of elements of the skeleton and differential preservation between individual burials. The pH value of the soil is the main factor influencing preservation. The burials at Lankhills were all cut into the chalk bedrock, an alkaline environment ostensibly favourable to bone preservation (Hunter et al. 1996, 60). Many other factors, however, may influence bone preservation. Among these are funerary treatment, animal and root activity, bone size, bone density, and the age, sex and health status of the deceased (Chamberlain 2000; Henderson 1987; Waldron 1987). For example, the micro-environment immediately around the corpse greatly influences bone survival, and may include objects or materials placed within the coffin. The type of wood used in coffin construction may also influence the local pH, and hence bone preservation, oak being particularly acidic. It has been observed that when a buried corpse is surrounded by vegetable matter (for example, straw or pine branches) there is more rapid decomposition than those buried without this material (ibid., 69). The leaves of the plant Box (Buxus sempervirnes) have sometimes been found in Roman burials, as they were believed to keep the grave sweet and perhaps served as a symbol of eternal life (Campbell and Hall 2006, 32-3). Factors such as these may partially explain the complex issue of differential preservation observed on site.

7.3.39  There appears to be some spatial clustering of possibly related individuals within the cemetery. There are also small clusters of subadults. Generally within the groups there is no spatial differentiation between males and females.

7.3.40  At least two individuals (both male) were over 1.8 m tall (6ft). Final achieved height is considered to be a very sensitive indicator of environmental conditions encountered during the growing years (Steckel 1995). The height of the two males from Lankhills may indicate that at least some of the population enjoyed good childhood health and nutrition.

7.3.41  The prevalence and nature of the pathology will greatly enhance our knowledge of health and disease during this period. The large size of the population will allow the calculation of meaningful prevalences. These may be compared with
other contemporary populations, such as Poundbury (Farwell and Molleson 1993) and Butt Road (Crummy and Crossan 1993).

7.3.42 In general, the cremated material from Lankhills comprised large fragments (whole bones such as vertebrae and phalanges and large fragments, over 10 cm long, of long bone observed in 6 out of the 9 cremations assessed) and frequently weights of over 800 g. They were also well preserved with readily identifiable skeletal elements.

7.4 Recommendations

Articulated skeletons and cremated remains

7.4.1 It is recommended that all skeletal material from Lankhills undergoes full osteological analysis, and that the results be interpreted in a detailed osteological report. The fact that over half of the skeletons from the entire assemblage are assessed as being at least 50% complete justifies this level of work.

7.4.2 Clarke (1979) uncovered 451 graves, from which 409 unburnt skeletons and 7 cremation burials were available for analysis. The full skeletal report is not yet available and the publication presented only a preliminary examination of the skeletons. This examination also took place before the development of many techniques now used for ageing and sexing. However, a separate study has recently re-examined the assemblage (Gowland 2001, 152-168). This study re-evaluates the age and sex of all of the skeletal remains, the results of which have been made available for the present study. Meaningful comparisons for age and sex may, therefore, be made with the Clarke assemblage. Collation of the two data sets will result in a larger and more meaningful sample - one of the largest assemblages of the late Roman period. Unfortunately there is no description of the cremation burials from Clarke’s excavation, which severely impedes any comparative analysis between these and the material recovered in the recent work.

7.4.3 In general, the weights, fragment sizes and condition of the cremation material from Lankhills all indicate that the material has considerable potential for analysis of MNI, estimation of sex and age at death, analysis of pathology and the identification of pyre goods mixed within these deposits. There is also considerable potential for further refinement of observations relating to pyre technology (for example, duration and temperature of the cremation) and associated practices (for example, the collection of burnt remains from the funerary pyre, and final deposition in the grave). Hence, all deposits of cremated bone warrant further examination, including a more thorough examination of residues for bone and small artefacts to maximise these analyses.

7.4.4 The cremation burials have been provisionally dated to the late 3rd and 4th century AD, on the basis of pottery typology. They are therefore much later in date than the majority of other British cremation burials. The excellent condition of the deposits may enable comparisons with the inhumed population, in order to identify any differences in palaeodemography between the two groups (although the number of cremation burials is small). The in situ cremations are also much later in date than most other Romano-British examples, although Philpott (1991) notes two rectangular pits from Bray, Berks., dating to AD 325-50, although the basis of this dating is uncertain and other aspects of the chronology of this site, which has never been fully published, are questionable. The in situ cremations...
from Lankhills should be investigated thoroughly to ascertain whether they are indeed, *busta* (as mentioned in 5.2.12) and to secure their late date, which may indicate a much longer use of this rite than has been previously thought.

7.4.5 To understand the entire assemblage in its wider context a comparison with the contemporary urban cemetery of Poundbury, Dorset should be made. This assemblage comprised 1131 skeletons dating from the 3rd and 4th centuries AD, and a detailed osteological analysis has been published (Farwell and Molleson 1993). Other contemporary sites, such as Butt Road, Colchester, contained 700 inhumations (Crummy and Crossan 1993). Further sites such as Kelvedon (Rodwell 1988) also date from this period and should be compared to Lankhills.

*Disarticulated human remains*

7.4.6 A small quantity of disarticulated material was recovered from the site, largely redeposited within later graves. This is not normally considered of value for analysis. However, as this cemetery had a relatively low prevalence of intercutting burials, it is possible that, in several cases, the disarticulated material found in the backfill of the grave may belong to one individual who previously occupied the same grave as the articulated individual. Disarticulated bone may be examined to estimate minimum number of individuals and record evidence for pathology, and age and sex. Analysis of the disarticulated material from Lankhills would give a clearer idea of how many people were originally interred within the cemetery. Further, since it is feasible that preliminary assessment may have misidentified ‘loose’ human bone as animal bone, osteological analysis of the material may facilitate reinterpretation of features. It is therefore recommended that this material is analysed.

*Biochemical analysis*

7.4.7 Stable isotope analysis of the skeletal remains would significantly compliment further osteological analysis and archaeological investigation, particularly of factors relating to the identification of a non-local population at Lankhills and dietary practices.

7.4.8 Non-local populations may be explored through the analysis of Strontium (Sr) and oxygen (O) isotopes which indicate the most likely location of drinking water that was consumed during childhood, and by inference childhood residence. Recent research undertaken by Evans *et al.* (2006) examined the strontium and oxygen isotopes in the teeth of a select group from the Lankhills cemetery excavated by Clarke (1979). This research was undertaken in order to identify an immigrant group buried amongst the population, the so-called Danubians, who had been identified on the basis of their grave goods. The work on nine skeletons established that four probably had a childhood in Eastern Europe. A number of graves containing similar dress fittings were discovered during excavations by OA. It is recommended that a similar isotope study be undertaken on these individuals. It may also be useful to investigate any individuals who display cranial or post-cranial features that are biologically distinct from the general Lankhills population.

7.4.9 Stable carbon (C)and nitrogen (N) isotope ratios in bone tissue show a firm relationship with foods consumed in life. These isotopes may determine whether a diet was high or low in marine, meat or vegetable produce, as has been done for the Anglo-Saxon cemetery at Berinsfield, for example (Privat *et al.* 2002).
These isotopes can also be used to examine more specific questions, such as patterns of infant nutrition including breast feeding (Fuller et al. 2006). In these studies, human remains are best seen against the local pattern of animal isotopes. Contemporary animal bone assemblages would be readily available from the recent OA excavations at Staple Gardens, Winchester. Moreover, the value of such an analysis will be considerably enhanced by comparative data from the nearby early Anglo-Saxon cemetery and settlement sites of Worthy Down, a study currently being undertaken at Oxford University by Bradley Hull, under the supervision of Professor Robert Hedges. Further comparative data would be available from another of Professor Hedges' students engaged in work on the late Roman cemetery at Cirencester. The current and potential analyses will be most effective if they use substantial datasets to minimise the risk of distortion of results based on small samples (see section 10.8 below).

7.4.10 DNA analysis using teeth or bone from archaeological material may be used to explore kinship and establish sex. Samples for DNA were routinely collected during the excavation. It may be used to identify familial relationships between skeletons, but since no clear clusters of burials were identified during the initial site assessment at Lankhills, the value of this analysis may be questioned. Ancient DNA has also been used to identify disease, such as tuberculosis, although the potential for this may be limited at Lankhills. In view of the currently perceived low potential and the very considerable cost of human DNA analysis it is proposed that this should not be carried out at the present time, and that resources instead be concentrated on a programme of isotope analysis. The samples can be made available in the event that a relevant research programme is initiated (probably in the context of PhD research).

7.4.11 Radiocarbon dating of selected skeletons and cremation burials may be of value for exploring the length of time that the site was used as a burial ground. Artefact dating does suggest a late date for a number of burials, and it would be useful to assign an absolute date to these burials. The late date of the cremations on this site is interesting, and the occurrence of in situ cremation burials is particularly notable; these burials would benefit from absolute dating independent of artefactual sequences. Comparisons between artefactual dating of later burials and radiocarbon dating may also reveal whether curation of artefacts at the end of the Roman period in Britain was significant.
8 ASSESSMENT OF ENVIRONMENTAL EVIDENCE

8.1 Animal bone

By Kris Poole

Introduction

8.1.1 A total of 502 refitted fragments (6,850 g) of animal bone was recovered from 94 contexts during hand excavation. Unstratified and modern material, including that from the backfill of previous excavations, has been excluded from this assessment. All of the bone analysed was hand collected.

Methodology

1.1.1 Material was identified using the reference collection of Oxford Archaeology, along with relevant identification manuals (Schmid 1972; Cohen and Serjeantson 1996; Hillson 1996). Attempts were made to identify all bone fragments to element and species, although ribs, vertebrae (except atlas and axis), and skull fragments were classed as large-, medium-, and small-sized mammal. Methods of Boessneck (1969) and Payne (1985) were used to distinguish between sheep (Ovis) and goat (Capra). Bones were recorded using the zoning systems of Serjeantson (1996) for mammals, Cohen and Serjeantson (1996) for birds.

8.1.2 Measurements were taken following von den Driesch (1976) for mammals, Cohen and Serjeantson (1996) for birds, and was restricted to long bones of mature specimens. Where possible, pigs were sexed on the basis of their canines (Schmid 1972), with morphological traits of the pelvis and horn cores used to sex cattle and sheep/goat (Grigson 1982). Presence or absence of tarsometatarsi cockspurs was used to differentiate male and female domestic fowl (Sadler 1991), as was medullary bone in femora (Driver 1982).

8.1.3 Methods employed for ageing specimens were dental eruption/attrition, and epiphyseal fusion. Grant’s methods (1982) were used for recording tooth wear in cattle, sheep and pig, with wear stages being assigned using standards set out by Halstead (1985) for cattle, Grant (1982) for pigs, and Payne (1973,1987) for sheep. Fusion data was used to assign ages to cattle, sheep and pigs using data given by Getty (1975). Horses were aged through tooth crown heights (Levine 1982). As bird bones lack epiphyses, they were recorded as ‘fused’ or ‘unfused.’

8.1.4 Butchery patterns were recorded in detail using the standards set out by Lauwerier (1988), with burning and gnawing also recorded.

Results

8.1.5 Bone condition ranged from excellent to very poor, with the majority being fair to poor (Table 15, condition 3-4, based on the classification of Lyman 1996, in which category 1 is very good and 5 very poor). This resulted in only 27% of specimens (excluding partial skeletons) being identified to species.

8.1.6 Cattle, sheep/goat and horse were the best represented species (Data in Archive). The relative importance of domestic fowl bones has been inflated by the presence of a partial skeleton in context 738 (Group 870), which contributed 95 bones to the total, and seems to have been placed outside the coffin at the same time as the burial. Both femora from this animal had medullary bone in the marrow cavity, indicating this chicken was female, and killed whilst in lay. The only other clear evidence for deliberately-placed deposits of animal bone are two horse skulls, each placed halfway up the backfill of their respective different graves (one in context 603, Group 655 and one in context 1543, Group 1547). Both were positioned in the correct anatomical position, the superior portion of the skull being uppermost, and the skull in 603 was accompanied by two ceramic vessels, one of which was inverted over the nasal area. Using tooth crown heights, the horse skull in 603 was from an animal aged between 7.5 and 10 years of age at death, and that from context 1543 aged 6 to 8.75 years at death. In addition, disarticulated elements (metatarsals and phalanges) from a dog’s hind foot recovered from context 1149 (Group 1215) fit together, and may also come from a placed deposit. Whether any of the remaining bones were deliberately placed is unclear (see below).

8.1.7 Of the body parts identifiable to species, around 47% consist of teeth and mandibles, with a further 29.6% coming from the feet. An interesting difference is evident between cattle and sheep, with 45% of cattle bones consisting of teeth and mandibles, compared to 67% for sheep. This pattern is possibly a result of differential preservation, as will be discussed below.

8.1.8 Little ageing information was available for the animals represented at Lankhills, partly due to the lack of surviving epiphyses. All cattle epiphyses had fused; a distal 2nd phalanx came from an animal that had reached 15-18 months of age before death, two distal metatarsals represented animals of at least 24-30 months before death, and a proximal femur was from an animal aged at least 36-42 months. This seems to be backed up by dental attrition, which indicates that 1 old adult and 1 senile animal were present, although an animal aged 8-18 months old at death was also noted. The pattern is rather different for sheep, for which there are insufficient epiphyseal fusion data, but dental ageing suggests the presence of two animals aged 0-1 month old, one aged 6-12 months, one of 12-24 months, two of 2-3 years and 1 of 3-4 years. For pig, an animal of at least 10-12 months old was represented by a fused distal 2nd phalanx, and a fused distal humerus came from an animal aged 15-18 months old at death. As for horse, two fused distal 1st phalanges came from animals at least 24 months old at death, two fused distal humeri from animals at least 12 months old at death, and a mandible from context 1792 was from an animal aged 5.25-7.75 years at death.

Discussion

8.1.9 Animal remains are recovered from inhumations in all areas of Roman Britain, with birds, in particular chickens, being one of the most frequent classes of
animals recovered (Philpott 1991). The presence of bones in a grave suggests a concern to provide the deceased with food, at least symbolically (Lauwerier 1993, 78). However, not all of the animal remains need represent food, as dog and horse were not commonly eaten during the Roman period (Grant 1989), and it is possible that those at Lankhills are indicative of some other aspect of the deceased’s, or of the community’s, identity. Both dog and horse tend to be infrequently represented in both inhumations and cremations, leading Lauwerier (1993, 77) to conclude that horses were hardly ever, if at all, used as sacrificial animals, and were horses were probably never generally part of the funerary ritual. However, horse remains were present in cremations from Hardham, West Sussex, Ospringe, Kent and Kemps Yard, Ashton, Hampshire (Philpott 1991, 283-284; Bond and Worley 2004), and in inhumations at York (Luff 1982, 176, 185-189). Dog remains are also found in a number of inhumations, including intact animals at Ilchester and Maiden Castle, as well as skeletal parts. In earlier excavations at Lankhills, the remains of two dogs were recovered from an otherwise empty 4th century grave (Clarke 1979, 239-245). At Asthall, Oxfordshire, a child skeleton had discrete piles of bones from a dog’s feet (from the hind and forelimbs) at each corner of the body, indicative of burial within a dog skin.

8.1.10 As for the rest of the assemblage, it is perhaps no coincidence that teeth and mandibles are so well represented, and this may be explained by taphonomic factors. Indeed, it is possible that the fragmented nature and relatively poor condition of the bone indicates that much of the rest of the assemblage represents material lying around the site, which was subsequently incorporated into the back fill. The greater the porosity of bone tissue, the greater the susceptibility of that tissue to chemical degradation, weathering and other taphonomic processes (Lyman 1996, 418). Tooth enamel, with its high density and low porosity is the most resistant skeletal tissue, frequently surviving where bones do not, and mandibles and foot bones represent some of the densest skeletal elements. This may also explain why younger animals are so poorly represented, as skeletal elements of these animals tend to be more porous than skeletally mature animals. In addition, Von Endt and Ortner (1984) found that small bone particles tend to preserve less well than large bone particles, perhaps suggesting why a higher proportion of sheep/goat remains, compared to cattle, consist of teeth and mandibles. The lack of surviving epiphyses, which are less dense than the bone shaft, may also support a taphonomic explanation.

8.1.11 However, animals are often represented in Roman graves in many areas of Britain by jaw bones, and not all of this can be explained by taphonomic bias alone. It is possible that these represent token offerings; the inedible counterparts of joints of meat consumed by the mourners as part of the funerary rites, or as symbols of status or social identity (Philpott 1991, 203).

Statement of potential

8.1.12 Given the small size of this assemblage, and the lack of ageing/sexing information, it has no potential to inform about husbandry systems in the area of Lankhills during the Roman period, but the fact that at least some of the remains were deliberately deposited in funerary contexts means that they would not necessarily directly reflect everyday uses of animals anyway. However, there is potential for the bones to inform about the use of animals in expressions of identity in the past, and to this end, further parallels for the horse, dog and chicken remains should be sought, and these finds reported upon.
8.1.13 The animal bone data can be found on a Microsoft Access database, and although no further recording is required for this assemblage, further stratigraphic analysis may clarify the processes (natural, anthropogenic, or a mixture of both) leading to the inclusion of many of the bones within graves. At this time, further analysis and reporting on the rest the material may be warranted.

8.2 Charred plant remains and charcoal

By Ruth Pelling

Introduction

8.2.1 A total of 80 flots was assessed for charred plant remains. Seventy-four of these were from single samples and the others were two sets of three samples from spits 7 and 9 from cremation urns (sample <1554> context 424, fill of urn 405 and sample <1552> context 1008, fill of urn 1007).

Methodology

8.2.2 Each flot was put through a stack of sieves to break it into manageable fractions. Each fraction was then scanned under a binocular microscope at x10 to x20 magnification. Any charred seeds or chaff were provisionally identified and an approximation of abundance made (1-10; 11-50; 51-100). Random fragments of charcoal were fractured and examined in transverse section to identify the presence of Quercus (oak) or non-Quercus taxa. An abundance of charcoal fragments greater than 2 mm was noted on a relative scale (present, common, frequent, abundant). The presence and abundance of other biological material, particularly molluscs, was also noted. The assessment results were entered into an Excel spread sheet. Samples with potentially useful material are displayed in Appendix Table 9 for charcoal and Appendix Table 10 for non-charcoal plant remains below.

Results

8.2.3 The Lankhills samples produced mainly mollusc-rich flots of varying size. The majority of flots were small to moderate in size and contained small quantities of fragmentary charcoal. Samples which contained frequent or abundant charcoal are shown in Appendix Table 9.

8.2.4 Of the 80 flots, charcoal fragments greater than 2mm were present in 64, including 7 spits from sample 1554 and 5 spits from sample 1552. Generally the charcoal was present in low quantities or occasionally with larger quantities of very fragmented, unidentifiable, charcoal and was mixed with both Quercus and non-Quercus taxa present. Six samples produced Quercus only charcoal. Frequent or abundant quantities of charcoal were present in eight samples, three of which were derived from large samples (70 – 120 litres). The charcoal rich samples were from one grave (sample 957, context 1148), six cremation graves (samples 722 context 808, sample 936 context 1121, sample 1368 context 1661, sample 1416 context 1628, sample 1428 context 1842 and sample 1430 context 1843) and one unclassified cremation (sample 258 context 428). A further nine samples produced smaller but still useful quantities of charcoal. The remaining samples produced no or only occasional flecks or fragments.
8.2.5 A total of 35 flots produced charred plant remains other than charcoal. Of those occasional cereal grains were present in 14 samples. Grain of *Triticum* sp. (wheat), *Hordeum vulgare* (barley) and *Avena* sp. (oat) were noted. The *Triticum* grain included examples which were short and rounded, with rounded ventral surfaces, typical of free-threshing varieties which would be unusual for this period. No definite examples of *Triticum spelta* (spelt wheat), the predominant species of the Roman period in southern Britain, were identified. The numbers of grains involved are too low to speculate as to any significance in the presence of free-threshing wheat, more generally associated with Saxon and later periods. It is possible that the material in these samples represents either imported grain, or a shift in preference to free-threshing wheat with the arrival of a non-British population locally. The number of grains involved is very low and it is unlikely that the deposits represent deliberately placed offerings in the graves or cremations, but rather are probably the result of background scatters of charred cereal waste.

8.2.6 Occasional examples of *Prunus spinosa* (sloe) fruit stones are likely to represent the remains of fruit burnt with cremation wood rather than deliberately placed offerings of fruit. Tubers of *Arrhenatherum elatius* (false-oat grass) were present in nine samples. Weed seeds were present in 13 samples. The weed species noted were dominated by low growing grassland taxa including *Trifolium/lotus* types (clover, trefoil), *Ranunculus* sp. (buttercup), *Plantago lanceolata/media* (plantain) and grasses. *Arrhenatherum elatius* is a species of rough grass which readily invades cultivated ground once abandoned. The tubers are frequently found in charred deposits of Bronze Age date, particularly cremation deposits, for example at the Rollrights, Oxfordshire (Robinson 1988). Robinson has speculated that this is the result of material being torn up from grassland, possibly from abandoned fields, and burnt on cremation pyres (ibid.) rather than representing any kind of food waste. Its association at Lankhills with the seeds of other grass species would seem to support this.

**Statement of potential**

8.2.7 The non-charcoal plant remains are likely to be derived from material burnt with wood and turfs as fuel, with occasional background cereal remains, rather than representing plant material deliberately placed on the pyres for any ceremonial purpose. Several samples produced large quantities of charcoal, although they tended to be dominated by fragmented material too small for reliable identification. Of the eight samples with frequent or abundant charcoal greater than 2 mm and so more likely to be identifiable, only one appeared to consist of *Quercus* only, the rest being mixed. A further nine samples also produced charcoal in useful quantities, again generally mixed. The data from cremation sites of all periods are useful in establishing whether any patterns in wood use are local or more widespread and therefore possibly have religious or ritual significance. On this basis the material from Lankhills merits detailed work, but it is particularly important because very little work has been done on material from late rather than early Roman cremations. As well as providing key data for late Roman practice here it will be possible to compare and contrast these with evidence from early Roman sites.
8.3 Land Snails

By E C Stafford

Introduction

8.3.1 The solid geology at Lankhills, Winchester is Lower Chalk and the calcareous natures of the soils at the site are therefore generally conducive to the preservation of mollusc shell. Forty-three samples from a variety of feature types; pits, ditches, graves and layers dating from the 4th to early 5th centuries AD, were available for assessment from the excavations. The purpose of the work was to ascertain if the molluscan assemblages retrieved could provide data on the local site environment for the various phases of activity represented. At the most basic level the assessment aimed to:

- Determine the presence/absence of molluscan remains
- Give preliminary data on taxonomic content
- Indicate the potential for further work

Method

8.3.2 All samples were processed at Oxford Archaeology. Assessment was carried out on small samples, between 0.2 and 1.0 kg, specifically collected for the retrieval of molluscs. The sediment was floated in water onto 0.5 mm mesh and the flots dried. The residues were also sieved to 0.5 mm and dried. The flots were then scanned under a binocular microscope at magnifications of x10 and x20. Flotation was generally found to have given adequate shell recovery for assessment purposes.

8.3.3 The abundance of taxa was recorded on a sliding scale of + (present, 1-3 individuals), ++ (some 4-11), +++ (many 12-50), ++++ (abundant >50). An estimate was also made of the total number of individuals in each flot excluding Cecilioides acicula. This species was excluded because it burrows deeply and provides no useful information on conditions as a sediment or soil formed. C. acicula can be extremely numerous and its inclusion in the total tends to obscure the results from the other species.

Results

8.3.4 The results are presented in Appendix Table 11. For the purposes of assessment the species are grouped at a very basic level by ecological preferences following Evans (1972; 1984). Nomenclature follows Kerney (1999). Overall preservation and abundance of shell was found to be moderate to good, although frequent carbonate encrustation prevented identification of some specimens to species level.

8.3.5 On the whole features such as ditches that silt up naturally are the most useful in which to examine mollusc assemblages. Pits and graves are often usually deliberately backfilled leading to complex taphonomic problems. As well as shells that could potentially represent individuals living within the feature and those from the surrounding environment, assemblages may also contain residual shells from the soil used to backfill. However some useful broad environmental inferences can usually be made.

8.3.6 Overall, although molluscs were abundant in many of the samples assessed, the composition of the assemblages was very similar with little indication of spatial
or temporal variability. All assemblages were of low diversity, dominated by a few open country species. Numerically important species included *Vallonia costata* and *V. excenricia*, *Pupilla muscorum*, *Helicella itala* and the rare obligate xerophile *Truncatellina cylindrica* was noted in three samples. The catholic species *Trichia hispida* was also abundant. Shade-demanding species were virtually absent apart from very occasional zonitids, and single specimens of *Discus Rotundatus* and *Carychium tridentatum*.

8.3.7 The paucity of shade-demanding species, low diversity and species composition suggests that a long established, very open and dry environment, prevailed sometime prior, during and subsequent to the occupation of the site. The character of the assemblages is consistent with short-turfed grassland, possibly well grazed or trampled, with patches of disturbed bare ground. There is no real indication of significant areas of shade such as scrub or unkempt grassland in the vicinity. The small shade-demanding component may represent a residual component hinting at previously less open conditions, though they could also reflect microenvironments prevailing within features as they infilled. Indeed the association of *Oxystichus cellarius*, *Discus rotundatus* and *Vitreus* spp. in some samples may be considered reminiscent of Evans' troglophilic faunas of rock rubble habitats (Evans and Jones 1973). Certainly the very low numbers of even the more catholic of the shade-lovers within the ditch fills perhaps suggests that the features themselves were being maintained/grazed during the period of infilling.

**Potential**

8.3.8 The assessment has served well in revealing the general character of the local environment for the period of activity represented at the site. However, the low diversity and similarity of the assemblages does not make them entirely suitable for analysis as it is unlikely further work would provide any significant additional ecological information regarding the local environment. It is recommended that the results of the assessment be included in the final report.

8.4 **Pollen**

*By Denise Druce*

**Introduction**

8.4.1 A single monolith <910> was taken for pollen. The monolith was sub-sampled and assessed for the preservation of pollen. A total of four sub-samples were taken from the 0.5 m long monolith tin, and these came from discreet lithological units visible in the sediment sequence.

**Methodology**

8.4.2 Sub-samples were taken at 0.09 m, 0.18 m, 0.38 m and 0.40 m depth, and these were processed for pollen using standard procedures (Faegri and Iverson 1989) and mounted in silicone oil. Two exotic (*Lycopodium*) spore tablets were added to each sample to provide a standard counting reference and to determine pollen concentrations. The pollen slides were examined with an Olympus BH-2 microscope using x400 magnification routinely. Counting was carried out over two cover slips and continued until a sum of at least one hundred land pollen grains, or 10 traverses of the cover slip was reached, whichever was achieved.
first. Pollen identification was carried out using the standard keys of Faegri and Iversen (1989) and Moore et al. (1991). Microscopic charcoal fragments and fungal spores were quantified where present, and plant nomenclature follows Stace (1991).

**Results**

8.4.3 The results show that pollen preservation in the sediments from the Lankhills monolith is poor (Table 16). Nearly half of the pollen grains were indeterminate, and those that were identifiable were poorly preserved. The sample taken at 0.18 m depth contained the most abundant pollen, which was dominated by *Taraxacum*-type (Dandelion-type) and Chenopodiaceae (goosefoot) pollen. The dominance of *Taraxacum*-type (dandelion-type) pollen is typical in poorly preserved pollen assemblages, as this pollen grain is easily recognisable even when in a degraded state. Essentially, although the represented taxa are typical of ruderal plant communities, which may have some bearing on the vegetation surrounding the site, the risk of preferential preservation/identification means that very little can be learned from the pollen data.

Charcoal and fern spores are scored on a scale of abundance where ++++ = frequent and ++++ = abundant. Pollen grains, fern spores and indeterminate pollen grains are shown as actual counts.

**Conclusion and Recommendations**

8.4.4 The assessment has shown that the pollen from Lankhills monolith <910> is poorly preserved. Subsequently there are no recommendations for any further pollen analysis.

**8.5 Soil Micromorphology**

*By Richard MacPhail*

**Introduction**

8.5.1 Two monoliths (1335 and 1345) were taken through deposits in an area of intercutting graves, cremations and pits in the central area of the excavation. Layer 1629=1654=1655 seals many of these features, and is itself cut by later
graves. The objective the soil micromorphological study at Lankhills was to establish whether this layer represented a turfline, as interpreted on site, and how long it took to form. The monoliths were cleaned and briefly described (Tables 17 and 18) in order to make this evaluation (cf Hodgson 1997).

</table>

Results

8.5.2 The two 0.40 m long samples comprised Monolith 1335 (Section 255, Table 17) and Monolith 1345 (Section 256, Table 18). Monolith 1335 was composed of extremely stony pit fills (1625 and 1627) which were more pale upwards (from brown to pale brown), and probably reflected a diminished organic content up profile. No clear boundary between layers 1627 and 1629 was discerned in the monolith, and it was thought best to leave the monolith relatively undisturbed rather than 'excavate' it to find this boundary. The difference between the extremely stony pit fills (1652 and 1653) and the supposed turfline (1654) was clearly evident in monolith 1345, however. The rather massive nature of layer 1654 could argue for it being a turfline formed over the pit fill, and therefore
arguably representing a period of stasis between the use of the pit and later grave cutting.

**Statement of potential**

8.5.3 The present samples can be used to shed light on soil formation processes and therefore on aspects of the use of parts of the site. Various 'turflines' and buried 'turf lines' formed on chalky soils have been investigated from numerous sites by both soil micromorphology and chemistry, such as at the Experimental Earthwork at Overton Down, Wiltshire, and at sites such as Balksbury, Hampshire and Maiden Castle, Dorset (Crowther et al. 1996; Macphail, 1991; Macphail et al. 2001). It should therefore be possible to identify the turfline (1654), and also ascertain the presence of a turfline from layer 1629, although this was not clear in the monolith. It may also be possible to both suggest a length of time for the formation of this turfline, and additionally identify the site formation processes involved. It will be interesting to see if any specific land use(s) can be ascertained, as extra-mural cemeteries had various other uses – which may explain the presence of the pits (Cowan 2003; Dalwood and Edwards 2004).
9 SUMMARY OF POTENTIAL AND UPDATED RESEARCH AIMS

9.1 Overall summary of potential

9.1.1 Assessments of the potential of individual categories of evidence are given above in the appropriate sections. Here the site is discussed (briefly) in more general terms.

9.1.2 The excavations of 2000-2005 have added significantly to our understanding of Lankhills, already acknowledged as one of the most important cemeteries known in late Roman Britain. Not only does the large number of well-excavated graves complement those already known, but new information has been recovered relating to the extent of the cemetery (particularly the identification of its northern boundary) and aspects of its internal layout (particularly the identification of clusters of pits as foci for subsequent activity). Evidence for burial rites generally follows the patterns established by Clarke's analysis, with the identification of further instances of decapitated and prone burials, for example, but the importance of cremation is enhanced in the recent sample, instances of this rite being concentrated in the vicinity of the pit features already noted. The combined results of the two excavations considerably enhance the potential of the site for analysis of spatial variation in burial rite as expressed by body treatment and position, and also as defined by associated grave goods. Detailed analysis of the latter, and in particular their position in the grave, was used by Clarke to suggest the presence of intrusive elements in the cemetery population. This conclusion, as indicated above, has been controversial, but has recently received some support from isotope analysis of a sample of the skeletons from Clarke's excavation (Evans et al. 2006), although the isotopes suggested that the intrusive group was potentially diverse in terms of origin. More widespread application of this technique could make a major contribution to understanding of several aspects of the cemetery's population and is proposed here. Meanwhile, the potential of artefact analysis to shed light on questions relating to the movement of people in the late Roman period has been confirmed by the work of Swift (2000). Moreover, some of the objects from the recent work at Lankhills may be exotic in origin. Hilary Cool (above) has identified an unusual hollow bracelet type, as well as a probable bead bracelet. The latter may be another type of object having particular associations with the Danube (Swift 2003, 337). The spurs also appear to be of a non-British type. These approaches, together with a more nuanced understanding of the theoretical issues involved in the archaeology of ethnicity (eg Jones 1997), can be combined to provide greatly enhanced understanding of a particularly interesting aspect of this site.

9.1.3 The finds analysis methodologies appropriate to these questions can be used in many other ways, in particular in combination with the evidence of the human remains. Treatment of the latter was the least satisfactory aspect of Clarke's report, which presented only summary age and sex data. Detailed publication of the human remains from this and other Winchester sites is still awaited, but a dataset for the 1960s and 70s work at Lankhills, prepared by Dr Rebecca Gowland using more up to date methodologies than those available to Mary Harman, has kindly been made available to OA and will be used as a basis for comparison of the human remains from the two main phases of excavation. Use of this dataset gives the potential for examination of the whole excavated group not just with updated age and sex information but taking account of pathology and non-metric and other characteristics.
9.1.4 It is hoped that an integrated approach to the combined analysis of cemetery morphology, grave types and orientation, grave goods and skeletal remains can be achieved for the whole of the data for the Lankhills cemetery, but this will involve the expenditure of some resources in producing datasets of the evidence from Clarke's excavation. This will, however, substantially increase the value of the more recent work and allow direct comparison of the two parts of the site. It will also provide the opportunity to apply techniques such as correspondence analysis to the entire dataset. Overall, cemetery assemblages are particularly suitable for the application of a variety of statistical analytical approaches (eg Cool and Baxter 2005).

9.1.5 In general terms the analysis and reporting of the cemetery will benefit from developments in cemetery studies in the time since Clarke's publication in 1979. These are seen at a general level (eg Pearce et al. 2000) and also within a specifically British context, not least Philpott's general (1991) survey of Romano-British burial practice. Nevertheless the number of well-published substantial Romano-British cemeteries (ie with more than c 200 burials) remains very small, the principal 'post-Clarke' examples being Cirencester (McWhirr et al. 1982), Butt Road, Colchester (Crummy and Crossan 1993), Poundbury (Farwell and Molleson 1993) and London (Barber and Bowsher 2000), supplemented by the essentially post-Roman site of Cannington (Rahtz et al. 2000) and earlier cremation cemeteries such as King Harry Lane (Stead and Rigby 1989) and the rather smaller site at Brougham (Cool 2004). The number of significant publications of continental cemetery excavations has also not been particularly large (see eg Pearce 2002 and pers. comm.). The paucity of the British corpus underlines the continuing importance of Lankhills, now enhanced by the increased sample size. Moreover, the recent publications appear to underline the unusual nature of Lankhills in a 4th century context, among other things in terms of the proportion of graves which contain associated objects - roughly 25% of all inhumations from the recent work had associated grave goods (excluding footwear). This is a high proportion when compared with most contemporary sites, but while the contrast is valid in relation to Cirencester, Colchester and Poundbury, it is not so in relation to the East London cemeteries. There some 24% of the 513 recorded inhumation burials contained burial goods (Barber and Bowsher 2000, 117), a percentage that was maintained fairly consistently through all phases of the cemetery, ie throughout the Roman period, albeit that the overall popularity of inhumation increased with time (ibid., 12, table 4). The London data also show notable differences in the chronological distribution of grave goods in inhumations in relation to sex. A significantly higher proportion of early Roman female burials was accompanied, but in the 4th century this figure is rather reduced, while the proportion of male burials with grave goods increased at the same time (ibid.).

9.1.6 It remains to be seen if any comparable patterning can be derived from 4th century Lankhills, but the comparative evidence currently available emphasises the highly unusual if not unique character of Lankhills as a large, richly-furnished yet exclusively late-Roman cemetery, in which respect it does contrast markedly with the London evidence. The principal urban comparanda can be seen in other ways; for example large parts of the cemeteries at Poundbury and Butt Road have been characterised as Christian (although not without dissenting voices, eg Millett 1995), while at Cirencester (McWhirr et al. 1982, 76-8) and London (Barber and Bowsher 2000, 322) no conclusion was reached. Macdonald (1979, 424-433) tentatively identified possible Christian graves in the first Lankhills excavation but accepted that the evidence was 'generally inconclusive'
(ibid., 430). In this characteristic, therefore, Lankhills is not obviously distinct from all the other major urban cemeteries.

9.1.7 Overall, therefore, Lankhills is intrinsically important as one of only a small sample of well-excavated and reported Romano-British urban cemeteries. It shares some morphological characteristics with a number of these (Butt Road, Poundbury and East London) and like the majority of the burials from Butt Road, Poundbury and Cirencester is exclusively of late Roman date. Unlike all except East London, however, Lankhills is relatively rich in terms of grave goods, and it is this specific combination of date and grave-good provision which makes the site stand out in relation to others. That the cemetery seems to have contained burials of a number of late Roman official/military personnel (at least on the basis of the crossbow brooches) is probably only part of the explanation for its particular character, the interest of which is added to by the demonstration of non-native elements in the population.

9.2 Updated research aims

9.2.1 The updated research aims and objectives are derived from the potential of the data established in sections 5, 6 and 7 and the overview of potential given in section 8.1 above. This section follows recent guidance from English Heritage regarding the formulation of updated project aims (English Heritage nd, 2-3). This recommends that it is helpful to treat aims as major themes or goals to which specific objectives contribute, and to think of aims and objectives as questions. The aims identified in this section are all ones which can be addressed using various aspects of the Lankhills dataset through the analyses proposed, although it cannot be certain at this stage that all the questions will be answered clearly.

Chronology of the cemetery

9.2.2 Present evidence indicates that the use of the cemetery begins in the early 4th century and continues to the end of the century and perhaps into the early 5th. The dating is based on artefactual evidence in combination with the evidence of vertical and horizontal stratigraphy. The closing date of c AD 410 was defined by Clarke on the basis of the absence of Quoit brooch style metalwork, but seems hard to justify. Refinement of both lower and upper limits of the chronological range of the cemetery is extremely important. The upper limit needs to be considered in relation to what is known of the latest developments within Winchester, including the possibility that elements of the cemetery at Victoria Road may be as late or even later in date than Lankhills (Kjolby-Biddle 1992, 216). In addition the site can be considered in relation to the pattern of early Anglo-Saxon settlement, and particularly the chronology of the mid 5th-7th century cemetery at Worthy Park, Kingsworthy, only 3 km distant (Hawkes and Grainger 2003). It is proposed that a programme of radiocarbon dating be applied to a sample of the latest identified burials at Lankhills in order to test the suggestion that the use of the cemetery might have extended further into the 5th century than appears at present. Specific chronological questions are:

9.2.3 Is there any chronological distinction between the earliest burials and other feature types such as gullies or pits that might represent pre-cemetery activity?

9.2.4 When were the features defining the northern and eastern boundaries of the cemetery established, and when did burial expand across the eastern boundary?
9.2.5 When did burial begin in this part of the cemetery a. in absolute terms and b. in relation to the area of the 1967-1972 excavation to the south?

9.2.6 What does the artefactual evidence indicate about the date of the latest activity on the site, independent of any other dating techniques?

9.2.7 When did burial in the cemetery cease?

**Development of the cemetery**

9.2.8 Clarke proposed a model of development of the cemetery in which there was a broad chronological trend from west to east. This appears to be generally supported by the recent work, although in neither case was the progression completely clear cut - ie some late Roman burials are found in the western part of the cemetery. Within this broad framework a number of specific questions can be addressed:

9.2.9 What if any evidence is there for activity predating the cemetery?

9.2.10 Does the evidence from the 2000-2005 excavation exactly follow Clarke's scheme of development, or is this scheme less closely followed in the northern part of the site than elsewhere?

9.2.11 Do the apparent absence of linear organisation and the variations in the density of burials revealed in the recent work indicate a more organic development, possibly from multiple foci?

9.2.12 Can important individual burials be identified from the form of their graves and the nature of the funerary rites?

9.2.13 Did such burials influence the positioning and alignment of adjacent subsequent burials?

9.2.14 The possible turfline recorded sealing one of the areas of inter-cutting pits and graves suggests a hiatus in the placing of burials in this area. Does this indicate that the earlier features here pre-date the more general use of the cemetery? (see also 8.2.3).

9.2.15 Some of the north-south burials are demonstrably later than the west-east burials. Is this consistently the case and does their aberrant orientation represent the final break-down of cemetery organisation? Are they the graves of members of intrusive ethnic groups?

**Burial rites**

9.2.16 Burial rites can be discussed in terms of three closely related aspects: the treatment of the body, whether cremated or inhumed, with detailed consideration of the disposition of the remains (eg body position for inhumations and the evidence for practices such as decapitation); the nature and alignment of the structure within which the burial took place (ie cremation pit/urn, grave/coffin etc); and the provision, function and location of grave goods and other material within grave fills.

9.2.17 What is the significance of the large pits in the central part of the excavation, and how did they influence the location and nature of subsequent burials?
9.2.18 What are the spatial and temporal relationships between cremation and inhumation burials. What do the cremations represent in relation to the overwhelming number of inhumation burials?

9.2.19 Is there any spatial or temporal pattern to the minority rites, such as decapitation and unusual body positions and grave orientations?

9.2.20 How do these abnormal burials relate spatially, chronologically and symbolically to ‘normative’ burial rites?

9.2.21 What proportion of the cemetery population was buried in wooden coffins? What evidence is there for the detailed reconstruction of these and what are the significant correlates of coffined vis-à-vis un-coffined burial? Does the incidence of burial in coffins decline through time?

9.2.22 What is the relationship of grave size and particularly depth to factors such as biological sex, status and chronology?

9.2.23 Is there any evidence that graves were deliberately re-opened for the insertion of later burials? Does this represent the use of graves as family mausolea?

9.2.24 What is the significance of the location of grave goods, either within or outside the coffin?

9.2.25 What do the grave goods and other evidence tell us about late Roman beliefs about the afterlife? Can any graves be identified as Christian and, if so, on what basis?

9.2.26 What is the significance of the horse skulls placed in the back-fill of two graves? Can any parallels be found?

9.2.27 Can distinct ethnic or other groups be identified from their grave forms and funerary rites, including the evidence of artefact types and spatial disposition within graves?

**Artefacts**

9.2.28 Many of the most important aspects of the Lankhills artefacts are covered above, but there are numerous questions which are more specific to the material categories themselves or have importance for wider artefact studies. These include the following:

9.2.29 What proportion of cremation burials were placed in pottery vessels, and what are the characteristics of these vessels?

9.2.30 Is the chronology of cremation vessels different from that of the inhumations?

9.2.31 Are there any vessels associated with cremations other than those used to contain human remains?

9.2.32 What are the basic characteristics of the inhumation (grave good) assemblage?

9.2.33 How far can the dating of individual vessels be refined by detailed study of context and other associations?
9.2.34 How closely is it possible to demonstrate a correlation between vessel form and function in the funerary assemblage?

9.2.35 What evidence is there for the condition of vessels at the time when they were placed in graves and what does this tell us about the selection process?

9.2.36 How does the use of pottery in graves compare with that of other types of grave goods?

9.2.37 What is the significance of differences between the funerary assemblages from OA and Clarke’s excavations?

9.2.38 In what ways do the assemblages from features on the site other than graves differ from the funerary component?

9.2.39 In what ways does the range of ceramic grave goods differ from contemporary non-funerary assemblages in Winchester, particularly in terms of vessel type, function and sources of supply?

9.2.40 Can the chronology of New Forest pottery types established at Lankhills help refine understanding of the industry as a whole?

**The cemetery population**

9.2.41 How does the age and sex structure of the cemetery population compare with populations that are similar in date and type? Does it indicate that some form of selection took place as regards which members of the community could be buried here?

9.2.42 Why does the state of preservation vary so much from one grave to another? A detailed analysis of the state of preservation, not just from one skeleton to another, but also between bones of the skeleton may be revealing. It was observed during the analysis that preservation of bone could vary from one side of the body to the other, or from one end of the grave to the other. This varied preservation may indicate material being placed in the grave or coffin, which aids or inhibits decay of the bone. A cursory overview of the so-called Danubian burials suggests that skeletal preservation was particularly poor in this group. It will be useful to investigate this more critically in the analysis stage, as it may be suggestive of different burial practices within this group.

9.2.43 Given the large size of the assemblage there is considerable potential to investigate a range of questions relating to palaeodemography, general health and disease and many aspects of lifestyle, including activity patterns, food preparation and familial relationships. These may be compared with the recent analysis of Clarke’s 1970s assemblage undertaken by Rebecca Gowland (2001), who has kindly made her work available for comparative purposes. Aspects of demography identified in the assessment should be investigated further. One is the apparent predominance of males in the total assemblage. The second is the observed link between age at death and sex. This may reflect either differences in lifestyle or different cultural attitudes towards males and females in Romano-British society, which influenced both their general health and their longevity.

9.2.44 Ageing using dental attrition was not possible as early results revealed considerable under-ageing of skeletons when compared to other ageing methods,
such as auricular surface degeneration. It appears that the Lankhills population experienced considerably less tooth wear - a factor that may relate to food consumption patterns or food preparation. It will be of considerable interest to compare these findings where possible with other urban late Roman populations, such as Poundbury and Butt Road, as well as other late Roman rural populations where this pattern has not been observed. Is this an indication of differences in lifestyle between the rural and urban populations in this period?

9.2.45 The standard diaphyseal long bone measurements taken during the analysis of subadults may be used to construct growth curves that reveal growth patterns in a population. Growth of subadults is arguably one of the best indicators of the general health of a population (Larsen 1997, 8). It is seldom that a skeletal assemblage contains a large enough number of subadults to make such a study. By combining the data from Gowland (2001) and OA, a large enough sample will be available for meaningful analysis. These growth curves may be compared to those constructed for the contemporary Poundbury population (Mays 1999), as well to modern standards (Maresh 1955) and other British archaeological populations of different antiquity (e.g. Boston 2001; Hoppa 1992; Miles and Bulman 1994; Humphrey 1998).

9.2.46 A large proportion of grave goods, particularly jewellery was recovered from subadult graves. The Roman practice of providing burials of girl children with such grave goods is well known from classical literature (Martin-Kilcher 2000, 64-67). However, it is unclear if these practices were carried out in Roman Britain. Diagnosing the osteological sex of subadults is notoriously problematic and is usually not attempted. However, given the large size of the population and the numbers of children with permanent dentition, it is hoped that discriminant function analysis based on the crown dimensions of permanent teeth of subadults may be a means of addressing this problem, and may give interesting insights both into the burial practice discussed above and indeed, the palaeodemography of the assemblage.

9.2.47 The strontium and oxygen isotope analysis undertaken by Evans et al. (2006) suggests the possibility of different ancestral groups within the population excavated by Clarke (1979). The presence of different ancestral groups within the Lankhills population needs to be investigated further, using both skeletal and chemical analysis, with the appropriate background ‘local’ population for comparison.

9.2.48 Facial reconstruction (either digitally or by more traditional methods such as clay modelling) of one or two individuals would help ‘bring to life’ the people buried in the cemetery. The techniques can highlight anatomical abnormalities, ancestral differences and the appearance of wounds. Facial reconstruction makes archaeology more accessible to the general public. The skeleton from grave group 1638 is a good example. This individual had a substantial coffin in a large grave. He was found with coins in his hand, was well over 6ft tall and displays a possible facial defect. Such an individual would be suitable for illustration for publication.

**The cemetery in its wider context**

9.2.49 Understanding of the character and significance of the cemetery requires consideration of the wider context and characteristics of comparable late Roman cemeteries both in Britain and abroad. The sample of comparable major British
cemeteries, particularly those with fully published osteological data (cf section 9.1.5 above) remains small and the evidence from these sites will be taken into account in discussing Lankhills. Incorporation of data from continental sites is very desirable but does not readily fall within the scope of a project of this type. Consideration will be given to collaboration with academic colleagues in an attempt to address this issue.
10  METHOD STATEMENTS

10.1  Stratigraphy and phasing

10.1.1  The key to the implementation of a successful programme of analysis for a site such as Lankhills is the establishment of a robust and reliable dataset, including the site plan. Much of this dataset is in existence, but a number of tasks remain to bring it fully up to the required standard. These relate both to the context record and to the plan.

10.1.2  The context database has been thoroughly checked. Outstanding tasks include entry of interpretative keywords for contexts other than subgroups and the cross-referencing of digital images to individual context records. An important task will be the collation of data relating to the identification of coffins nails, coffin stains etc and the addition of this to the context database, assigning notional context numbers to the coffins.

10.1.3  Stratigraphic matrices for the most complex areas of the site were prepared in the course of the assessment. Detailed matrices for the remaining areas of the site are only required where intercutting features are present. Phasing of isolated graves and other features, as far as this is possible, will rely on artefact dating and perhaps on aspects of alignment and grouping with spatially related features.

10.1.4  The digital plan requires improvement in a number of areas. The working plan has been considerably improved during the assessment, but further refinement will be required to produce a completely reliable analytical tool. Subgroup (grave) numbers, the fundamental reference to each grave, need to be attached to the drawing – it should be noted that in the present version of the drawing the graves are only identified by their cut numbers rather than the subgroup numbers used in the text here. The linking of the skeletal images to the grave cut data needs to be reworked in order to facilitate analysis. In addition the digital data giving 3D locations of objects within graves (coffin nails, other small finds etc) need to be added to the CAD drawing so that these data can be fully used in analysis.

10.1.5  Once these tasks are completed work can begin on compilation of the grave catalogue, which will form a central part of the report and be the basis on which most of the analyses will rely. It will draw on the basic context record and will incorporate new data on coffins plus information from the linked datasets for all categories of finds and for human remains.

10.1.6  The site narrative will be relatively brief. The bulk of the report text will consist of the grave catalogue, the specialist contributions and discussion of analyses relating to the structure of the cemetery (overall plan, boundaries, non-grave features etc), the graves (plan size, depth, orientation, internal structures etc), coffins, body orientation and position etc, integrating the specialist data as appropriate.

10.1.7  The report will be fully illustrated. The site plan and feature sections will be presented as appropriate. The majority of grave plans will be illustrated, including all those with unusual structural features, grave goods (including hobnails), more than 2 or 3 coffin nails, and/or significant skeletal material. Grave profiles will generally not be illustrated, although significant examples will be selected.
10.2 Integration of data from Clarke’s excavation

10.2.1 A digital version of Clarke’s Table 2 (Clarke 1979, 24-95) will be required to provide consistent comparability with the data from the recent excavations.

10.2.2 Clarke’s site plan (1979, fig. 105) will also need to be digitised and fitted to the existing CAD drawing to produce a complete plan of the excavated part of the cemetery. Areas of overlap between the two plans will need to be rationalised.

10.2.3 The plans and records of the Clarke and OA excavations will need to be closely compared, together with the notes of other 1960s observations not included in Clarke’s grave catalogue (ibid, 8-10) to produce an authoritative list of graves eliminating duplication.

10.3 Pottery

10.3.1 The pottery from the graves will be fully recorded in line with standard OA procedures (Booth 1992-2005), with the addition of extra data fields appropriate for vessels from burials as used in recording the material from the Pepper Hill cemetery (Springhead, Kent) CTRL assemblage. The remainder of the assemblage will be fully recorded using the standard data fields. Quantification will be by sherd count and weight, vessel count and EVEs.

10.3.2 The pottery data will be entered into an Access database for purposes of archive and analysis in relation to other datasets for the project.

10.3.3 A report will present the data on non-grave features in summary form, but with due attention to context chronology and other matters as appropriate (particularly the redeposition of potential grave goods or cremation-related vessels). The pottery from the graves will be treated more fully, both in catalogue and discussion, including detailed comparison with the material from Clarke’s excavation. All the vessels associated with inhumation and cremation burials and related activity will be illustrated.

10.4 Coins

10.4.1 Cleaning of 58 Roman and 6 post Roman coins (already commissioned) will be undertaken. Identification of the coins will be refined after cleaning, using standard published references. The exact contexts of the coins will be clarified, with particular attention paid to the location of coins within graves. A report will be prepared discussing issues of chronology and deposition and comparison with the assemblage from Clarke’s excavation.

10.5 Small finds

Methodology

10.5.1 In what follows it is assumed that the specialist will do no more work upon the coffin furniture (see 6.3.5) as sufficient information has been recorded for the stratigraphic team to be able to identify the nails which still have information about wood grain direction if it is desired to explore joinery patterns. Further work on this material will be carried out by a research assistant.
Investigative conservation and material identification

10.5.2 The material will first need to be stabilised and conserved. The work required is detailed in Appendix Table 2. Three beads would benefit from having their material identified by an appropriate scientific analysis as it is currently not identified (sfs 3251, 2521, 2523). Although the worked skeletal material has been referred to as bone, some is likely to be antler and some bracelet fragments give the appearance of being ivory. The material is very decayed, however, and it is possible that inspection by an animal bone expert would not clarify this. It might be appropriate to submit some specimens to such an expert for their opinion. The mineralised textiles retain information about the weaving patterns in two cases. These should be submitted for an expert opinion. As noted in 6.3.6, in 11 cases (in the sample examined) nails retain sufficient mineralised wood for there to be the possibility of identifying the species if submitted to an appropriate expert.

Typology, dating and overview

10.5.3 The grave goods will be catalogued and discussed in burial groups. The discussion will provide typological date and sufficient comparanda to set them in context. Approximately 350 items will need to be catalogued and discussed. An overview will be produced placing all the graves within the context of the earlier excavations at Lankhills and more broadly within late Roman burial in Britain and, if appropriate given the possible immigrant community, elsewhere in the empire.

Illustration

10.5.4 Material will be selected for illustration and the finds researcher will liaise with the illustrator over the production of the illustrations. It is estimated that the line drawings that will be required are as follows:-

- 134 beads (this could be reduced if the multiple examples were just illustrated by typical examples, but if the site records enable stringing patterns to be reconstructed then it might be appropriate to illustrate them all. Again, however, this might be done in a simplified way).
- 2 bead strings on wire
- 50 bracelets (this estimates that c 10 bone bracelets will be illustrated)
- 16 items of belt equipment
- 7 brooches (6 of which are crossbows)
- 1 hair pin
- 1 ear ring
- 6 finger rings
- 6 knives (4 of which would best be illustrated from the X ray)
- 2 spurs
• 1 set of shears
• 5 miscellaneous items (inlay etc)
• 4 glass vessels (it is suggested that the specialist illustrate these and provide digital drawings).

Liaison

10.5.5 The specialist will attend project meetings and liaise with other team members as appropriate.

10.6 Worked flint

10.6.1 No further analysis is required. A publication text should be prepared using archive data and the assessment report as a basis.

10.7 Ceramic building materials

10.7.1 The Roman building material data should be recorded onto a database. It will be necessary to re-examine some of the more complete pieces and those with unusual features, but for most of the smaller fragments data need only be transferred from the paper copy. The pieces with unusual markings should be drawn. As part of the recording process the fabrics should be tied in to the Winchester fabric type series for ceramic building material.

10.7.2 Analysis of the tile should examine the relationship of the tile to the graves to establish whether the unusual character of the assemblage relates to construction or marking of the graves. The material is clearly reused, having originally served as roofing on the basis of the pattern of mortar adhering to some tiles. It will be worth considering whether there is any evidence for funerary structures that may have had tiled roofs and whether any such structures could have been exclusively roofed with imbrices in the Laconian system of roofing.

10.7.3 It is not recommended that any further work should be done on the post medieval – modern building material.

10.8 Human remains

10.8.1 The Roman burials are suitable for full osteological and palaeopathological analysis. In view of the importance of the assemblage the proposed analytical methodologies are set out in some detail below

Unburnt human bone

General terminology and equipment used

10.8.2 The anatomical terminology used in this report will be in accordance with international nomenclature. The descriptive teeth formula used will be based on the Zsigmondy system (Zsigmondy 1861 in Hillson 2005, 8-9). All bones and teeth will be analysed macroscopically.
Preservation and completeness

10.8.3 Bone preservation and completeness of the assemblage will be rated on a four-point scale, ranging from 1 (poor) to 4 (excellent) as defined above (section X). Likewise, skeletal completeness will be scored on a scale of 1 - 4 : 1 (< 25 %); 2 (25- 50 %); 3 (50- 75 %); and 4 (> 75 %). Possible causes of the differential bone survival and diagenesis on the site will be discussed.

Estimation of age at death

10.8.4 Diaphyseal long bone lengths will be used as the basis for ageing foetuses and neonates using methods developed by Fazekas and Kósá (as adapted in Scheuer and Black 2000). Subadults will be aged by the stage of dental eruption (Moorrees et al. 1963a and b), stage of epiphyseal fusion (Scheuer and Black 2000) and diaphyseal length of the major long bones (Marsh 1970).

10.8.5 The adult skeletons will be aged by degeneration of the auricular surface of the pelvis (Lovejoy et al. 1985), the sternal end of the ribs (İşcan and Loth 1986 a and b) and the pubic symphysis (Brooks and Suchey 1990; Todd 1921 a and b); late fusing epiphyses (Scheuer and Black 2000); dental attrition (Miles 1962), and suture obliteration (Meindl and Lovejoy 1985).

10.8.6 All individuals will be assigned to an age group as defined in Table 19. These are consistent with age categories used by Gowland (2001) in her analysis of the assemblage from Clarke’s 1970s excavations.

Estimation of sex

10.8.7 Sexually dimorphic features of the pelvis and cranium will be used to diagnose osteological sex based on standards set out in Buikstra and Ubelaker (1994) and Schwartz (1995). Osteometrics will be used as secondary sexual indicators. Sex will be assigned by employing the categories outlined in section 10.8.6 above.

Estimation of stature

10.8.8 Calculation of body stature will be estimated from the maximum length of the major long bones will be based on the method for Caucasians developed by
Sjovold (1990) and by Trotter and Gleser as modified by Trotter (Trotter 1970). Combined measurements of the femur and tibia will be utilised wherever possible, and in the absence of one of these bones the femur and then the tibia will be used. The major bones of the upper limb will be used if no lower limb bones are present. The left side will be used preferentially in keeping with standard osteological practice.

10.8.9 In the absence of complete major long bones, body stature will also be estimated from the mid-line length of the metacarpals according to the method developed by Meadows and Jantz (1992), and the maximum length of the calcaneus and talus (Holland 1995).

10.8.10 For comparative studies on stature between populations, it is recommended to use the actual bone measurement rather than the calculated estimates (Brothwell and Zakrzewski 2004, 33). The raw long bone lengths will be given as an appendix to the specialist report.

Non-metric traits

10.8.11 The descriptions given in Berry and Berry (1967) and Finnegar (1978) will be used to record non-metric traits.

Metrics

10.8.12 Measurements on the skull and postcranial elements will be taken using landmarks described by Brothwell (1981) and by Buikstra and Uberlaker (1994). These will be used in estimation of sex, and quantifying size and body proportions (such as the platymeric and platynemic indices) that may be activity related (Larsen 1997). A number of cranial indices will also be calculated, to explore the biological affinity of the population.

Skeletal and dental pathologies

10.8.13 The terminology and descriptions of the skeletal pathologies used in the report will be based largely upon palaeopathology texts, such as Ortner (2003) and Auferheide and Rodriguez-Martin (1998). Degenerative joint disease will be recorded as osteophytic growth, porosity and eburnation, according to the recommendations of Rogers and Waldron (1995).

10.8.14 Dental pathologies will be described in accordance with Hillson (2005), Ortner (2003) and others. Dental calculus will be recorded according to Brothwell’s methods (1981), and dental enamel hypoplasia according to Hillson (2005). The location on the tooth and severity of the carious lesions will also be described in the primary record.

The cremated bone

10.8.15 In accordance with recommended practice (McKinley and Roberts 1993), urns containing cremated human bone were lifted intact wherever practicable, and the contents were excavated under controlled laboratory conditions. The cremation deposits were excavated in 2 cm spits, each of which was planned, and a total soil sample taken. Because of the fragmentation of some cinerary urns, the above process was not possible. Such urns and unurned cremations were excavated carefully in the field by an experienced archaeologist or osteoarchaeologist,
emphasising maximum bone recovery. A bulk sample of the surrounding soil was also taken to capture any outstanding bone and artefacts. The bone and soil samples were then cleaned gently and sorted into >10 mm, >5 mm and >2 mm size categories.

10.8.16 Osteological analysis will be undertaken by following the recommendations set out by McKinley (2004). This will include assessment of bone weight, colour and fragmentation, identifiable elements, MNI, age and sex. Any pathology will be described and differential diagnoses explored. Aspects of funerary ritual, such as stratification of urned cremation deposits, the cleanness of the bone, presence of pyre or grave goods, and bone discoulouration due to association with metals, such as copper alloy and iron, will be recorded.

Reporting

10.8.17 A comprehensive specialist report will be compiled on the basis of the above data, detailing the demography of the burial population, prevalence of skeletal and dental disease and non-metric traits, and detailing osteometrics. All data will be entered onto a database and will be considered in their archaeological context, taking into account phasing and burial practices. Results will be statistically analysed by employing appropriate statistical tests.

10.8.18 Osteological findings will be compared with Gowland’s (2001) analysis, and where possible it is hoped that the two data sets will be combined. The osteological analysis from Lankhills will be compared with osteological work undertaken on contemporary skeletal assemblages, particularly from Poundbury, Dorset (Farwell and Molleson 1993). The prevalence of pathologies will also be compared to rates calculated for the Romano-British period by Roberts and Cox (2003).

Stable isotope analysis

10.8.19 The ideal sample size for C and N isotope measurements is about 200 humans. This is based on 4 dichotomous categories (i.e. male/female; young adult/old adult; early/late; rich/poor, with, say 16 samples in each = 16x8 = 128, with, in addition all children, all examples of individuals with interesting skeletal pathologies, and various additions, giving a total of c 200. In reality it may not be possible to achieve these figures. For comparative purposes a sample of about 100 faunal samples (25 of each of the main domesticated species plus some extras) should be measured.

10.8.20 Sr and O isotopes will need to be sampled for separately. For the proposed purposes 50 samples of each, plus 25 samples of each on selected faunal remains, should provide an adequate sample.

10.8.21 The results will be analysed and a report written.

10.9 Animal bones

10.9.1 No further recording is necessary. A publication text should be prepared using archive data and the assessment report as a basis. In particular, parallels should be sought for the inclusion of horse, dog and chicken remains in grave assemblages and their use in the expression of identity.
10.10 Charred plant remains and charcoal

10.10.1 The 17 samples that produced useful quantities of charcoal will be examined in more detail in order to establish species representation and examine the question of patterning in wood use in cremation contexts at the site.

10.10.2 It would be of interest to further explore the interpretation of burnt turfs: it is therefore recommended that a selection of samples containing tubers and weed seeds or with Prunus spinosa fruit stones should be sorted and a report produced.

10.11 Snails

10.11.1 No further work is required, but the conclusions of assessment report will be incorporated into the main publication report.

10.12 Soil micromorphology

10.12.1 A combined soil micromorphological (2 thin sections across 1629-1627; across 1654-1653) and bulk (4 samples 1629, 1627, 1654, 1653) study (Goldberg and Macphail, 2006) will be carried out to examine the putative turftline and attempt to identify any landuse practices in addition to that of a cemetery. Analyses of LOI, fractionated P and magnetic susceptibility including $\chi_{max}$ will help confirm the presence of turf and identify other activities and processes contributing to the formation of this layer.
11 **Publication**

11.1 **Proposed level and scope of analysis**

11.1.1 It is proposed that a full publication of the results of the 2000-2005 excavation is required, and that the results of Clarke’s excavation should be integrated as fully as possible with it. The publication will present an account of the excavation, a detailed grave catalogue and a discussion of the cemetery with relation to a wide range of aspects of morphology, chronology, human population, burial rite, artefact analyses and the social, political and economic conclusions that can be drawn from these studies. The objective of this approach is not only to provide an overall account of the site that takes account of Clarke’s results, but also to provide a level of reporting which allows comparison between the data from the two excavations at a reasonable level of detail. Specific questions for consideration are set out in Section 9 above and the recording and analytical methodologies are presented in Section 10. The report will be illustrated appropriately. This will include illustration of all significant grave groups, in line with the accepted general principle that complete grave groups should always be illustrated in full. A wider discussion will set the cemetery in its Romano-British context and will, as far as is possible, take account of relevant continental evidence.

11.2 **Format**

11.2.1 The proposed publication will take the form of an A4 monograph in the standard Oxford Archaeology Monograph Series house style. The publication will be extensively illustrated with line drawings and photographs - colour will be used where appropriate. The conventional aspects of the publication can be supplemented by the provision of detailed datasets on CD Rom, enabling users to pursue a variety of lines of analysis. This, however, will not be a substitute for the provision of fundamentally important data in print.

11.2.2 Other publication options are possible. These could include a web-based format accompanied by a more synthetic printed account which would present the discussions and conclusions but would not be data heavy. Such a style of publication is less well-suited to sites of the present type and this option is not preferred here. It should be noted, however, that in terms of overall production costs this option would be closely comparable to the more conventional and more extensive printed format which has been preferred, so either could be accommodated within the limits of the proposed project costs.

11.3 **Publication synopsis**

11.3.1 The following synopsis is based on the assumption that the publication will be of the form set out in 11.1.1 and 11.2.1 above. A provisional title, list of main authors and principal contents are set out below.

11.3.2 *The late Roman cemetery at Lankhills, Winchester, excavations 2000-2005*

| 3364 | knife | Iron and bone | Ask for a bone id |
| 3905 | blade | Iron | Needs section across |
| 4035 | knife | Iron, silver & bone | This is very unstable and cannot be handled easily. If possible it needs to be stabilised and the metal of the sheet binding identified - possibly also silver. |
| 4141 | ring | Iron | Section |
| 4190 | crossbow brooch | Copper alloy | Needs cleaning to stabilise textile so it can be handled, and define foot pattern |
| 4214 | spur | Copper alloy | These are such exceptional items that full conservation would be appropriate |
| 4243 | spur | Copper alloy | These are such exceptional items that full conservation would be appropriate |
| 4267 | bracelet | Copper alloy | Clean an area in case of decoration |
| 4268 | bracelet | Copper alloy | Clean one half - unusual pattern |
| 4363 | buckle and plate | Copper alloy | Needs cleaning |
| 4365 | Buckle and plate | Copper alloy | Plate would benefit from cleaning for illustration |
| 4402 | crossbow brooch | Copper alloy | Needs foot cleaning to define pattern |
| 4403 | buckle and plate | Copper alloy | Clean |

Project details

Project name: Winchester Lankhills Special School
Short description of the project: Between 2000 and 2005 Oxford Archaeology carried out a series of excavations on part of the major late Roman cemetery at Lankhills, Winchester. The excavations revealed 307 inhumation graves and 25 cremation burials to add to the 444 inhumations and 7 cremations already known from previous excavations on the site. The northern boundary of the cemetery was also identified. Localised areas of intercutting pits associated with cremation burials formed early 4th century foci for continued intensive activity within the northern part of the site. The human remains indicate a generally quite healthy population with reasonable life expectancy, a number of individuals being assigned to a '60+ years' age bracket. Neonates and infants were present but, as usual, only in small numbers. Use of the cemetery probably commenced early in the 4th century and continued at least to the end of the century.

Project dates: Start: 17-08-2000 End: 12-04-2005

**Type of construction work**
Topsoil Strip Slight Reduction NAT Chalk

**Contacts made**

**Archaeology present?**
No

**Remarks:**

W.B on Topsoil Strip in prep for housing renewal.
Green Stripped approx 40m in length 7.5 - 8m wide.
Other features revealed approx 12m due east of east wing L shaped building - (no longer present). Features comprise 2 Square pits 1.50 x 1.00m c. 3m apart running in line parallel with east wing L shape building, excavated into natural chalk. One feature (Southernmost) investigated by half sectioning - found to be 0.60m max depth backfilled with Topsoil and small chalk chippings containing blue and white china, glass and CSM. Retained. Other features had similar finds on surface of backfill. Probably relate to Victorian garden feature associated with small lodge building (E 19th C brick), which was demolished prior to visit. (probably free fills).

See attached plan for strip dimensions.

**Type of construction work**
TRIP TO FORMATION LEVELS

**Contacts made**
FRED, GRAHAM TUT

**Archaeology present?**
Yes: 

No: 

**Undated:**

**Other:**

**COMMENTS**

Final area stripped to chalk nat. and formation level.

Only shallow ditch/lynchet seen running SW/NE across site.

Finds collected - post-med. for single fill - dark sticky loam deposit.

Profile: + up to 3.5 m wide by 0.20 m deep

Believe this unimportant to warrant full excavation team usage.

Location recorded on plan, TP's sketch and photos retrieved.

A similar square feature was recorded in the south-west corner of the site - not known date or function.

COMMENTS

Continued digging foundations cut through another cellar.
And through layers of ground make-up.

Arrived c. 11.40am. met Fred Reeves who showed me the site.

Was introduced by Glenn - J (site manager).

Observed the 2nd phase of 1st northern soak-away being machine.

No archaeology present. Soil-aways c. 4 x 4m square
c. 45m deep, top 30cm (max.)= machine gravel 5tr.

2nd soakaway to be dug tomorrow.

See sketch plan 4

CAR PARK CONSTRUCTION

**Contacts made**

CLAWLYN LINE ENGINEER

**Archaeology present?**

Yes:

No: ✓

**Undated:**

**Other:**

**COMMENTS**

Continuation of stripping area for car park as per 21/8/03. Further away from cemetery so even less likely probability of burial outliers. No archaeology observed although some rubble present relating to previous (modern) building and 5th C broch drainage system.

**Note** on Tuesday (26th) will be undertaking some drainage related work nearer entrance to road, hence adjacent to burial site + perhaps more risk of graves?

* phone nick/angus re: Tuesday

**Records?** photos as per sheet.

COMMENTS

Monitored excavation of a roadside drain beside the main access road next to soakaway 2. The pit was 1.5m x 1.0m and 1.7m deep. 0.3m of scrapings overlay undisturbed natural chalk. The topsoil had obviously been removed during an earlier operation possibly for stripping for the access road.

Continued digging area.

Wet weather period a problem, so area of modern disturbance/interior were emptied by hand.

Finished machining c. 15:30 - off site.

Weather: Weather wet in morning, dry by afternoon.

Archaeology Present:

Yes: Estimated # of Graves:

No: Unexcavated = c. 120

Undated: Excavated = c. 25

Other: [145]

Comments:

All work = cleaning, surface or emptying
Modern intrusive features. Wet weather = big problem
Chalk surface = very fragile

BORIAL INVENTORY

[404] Grave cut containing cremation urn (406) and neonate skeleton (404).
   Neonate appears to have been crouched slightly towards the urn and the
   grave is oriented E-W.
   This feature is heavily truncated and has experienced animal disturbance
   (probably rabbit). G1P 445

SK436 SORpine juvenile skeleton oriented E-W: Poor condition with
   only 40-45% of skeleton surviving. Dental development indicates
   an age at death of 6 years ± 24 months (O'Brien 1989).

SK429 SORpine adult female skeleton, oriented E-W: Fair condition
   with approximately 75% of skeleton remaining. The degree of dental
   attrition (Loesch 1985/Booth & Ruff 1989/Miles 1983) suggests an age at
   death of 30-55 years.

   Age changes of the pubic symphysis indicate an age at death of
   48.1 ± 14.6 (34-63) years (Scheuer & Brookes 1989). However, attention
   must be drawn to the fact that degeneration of the pelvis post
   mortem may reduce the accuracy of this age estimate.
   Left tibia had been fractured and healed in a poor manner, which could
   have been disabling.

SK421 SORpine adult skeleton, oriented E-W & in poor condition.
   Skull has been badly damaged and nothing remains of the pelvis.
   However, well developed external occipital protuberance, mastoid process
   and mandibular condyle suggest that this individual is male.
   Dental wear patterns propose an age at death of approximately 40-45
   years (Loesch 1985) with a minimum estimate of 35 years (Miles 1983).

SK441 SORpine adult male skeleton, oriented E-W: The skull has been
   perfectly preserved but almost nothing remains of the pelvis, ribs
   and thoracic bones.
   Teeth were in good condition save for noticeable alveolar resorption
   and minor dental caries.
   The dental wear patterns suggest an age at death of 22-30 years.

**Comments (continue on reverse if necessary)**

14/12/03 1:30am - Security head checking on site - no one there when investigated.

15/12/03 Sam Ryan's section had been disturbed - no sign of digging but dirty great footprint in base of gable - not security's.

DAN KEELEGER REQUESTED SITE TOUR - DID NOT HAVE TIME - TOLD HIM V-NICELY TO GO AWAY.

**Description (See check lists):**

1. Circular
2. Bowl shaped: gently sloping sides, sides meet the bottom with a gradual break. Length 1.92m, breadth 0.82m approx. depth 0.68m.
3. Truncated by modern trench, also by a cremation pit, and potentially other great cut yet to be investigated. It also truncates an older grave below.

**Interpretation/Discussion:**

A cremation pit, with a lining of cremated ash and partially cremated bone, cutting through other graves (below). The cremation pit has been truncated by a modern trench, and is close to and potentially truncated by a cremation urn burial.

Cuts: 401

Fill of:

Matrix location
Relationships uncertain

Description (See check lists):
1. Rectangular shape is suggested but heavy truncation & animal activity distorts the overall shape.
2. Northern edge is bier & straight as exists.
5. All edges have been truncated, bier is slightly irregular. 3. 0 80 BY
0.9m and 0.60m depth from chalk surface = heavily truncated.
Fills: - Grav fill (425) , infant skeleton (404), span (405), umfill (424)
Deposit of broken material surrounding cremation urn (428)

Interpretation/Discussion
Grave cut containing cremation urn & infant inhumation.

</table>

**Description (See check lists):**

1. Irregular rectangle.
2. Flat bone, vertical sides.
3. Length 2.26m, width 0.90m at widest point. Depth 0.62m.
4. (429) skeleton, (416)
5. (429) skeleton, (416)
6. (429) skeleton, (416)
7. Rectangular grave cut on an east-west alignment with single individual skeleton.

**Interpretation/Discussion**

The skeleton appears to have a deformed lower right leg bone which may be a broken bone that was not set, or it is caused by rickets or [ 415 ] (cut D, C deficiency).

Description (See check lists):

1. Sub-rectangular
2. Flat base, steep/vertical sides
3. length = 2.20 m
   Width = 0.80 m
   Depth = 0.85 m
4. See additional sheet
5. -
6. Filled by Skeleton 441 and backfill 418.

Interpretation/Discussion

Regular shaped grave cut into upper chalk deposit. Sides are approximately vertical with only a small slope towards the grave's centre of 0.20m over the distance of total depth. The stabiil of the sides increases with the depth as the grave cuts relatively unweathered chalk.

**Description (See check lists):**

1. Friable
2. Mottled colouration of mid yellowish brown clayey silts and white (weathered) chalk. Occasional lenses of dark brown clayey silt
3. >10% - <30% angular fragments of chalk with occasional poorly sorted fragments of flint

**STRATIGRAPHIC MATRIX**

```
+400
+418
441
```

**Interpretation/Discussion**

Backfill of the grave which was a mixture of chalk fragments - presumably fractured dunny grave excavations - and clayey silts that were former top soils. The deposit matrix supported these components as relatively evenly spread lenses with a good indicator of mixing.

14 Cast nails were recovered.

**Description (See check lists):**

1. - 4. MIXED RE-DEPOSITED CHALK + FLINT WITH RE-DEPOSITED SOIL
5. & 6. WITHIN 419

7. - 8. Mattock / Trowel / Dry

**Interpretation/Discussion**

Backfill of grave. At level of coffin rails (1029-35), there was a noticeable variation with a considerably greater concentration of chalk and flint around the edges of the cut & a more soily fill within the area defined by the coffin rails - presumably marking the extent of the decayed coffin.

419 - GRAVE CUT  
420 - COFFIN  
421 - SKELETON  
422 - BACKFILL  
427 - VESSEL

**Interpretation/Discussion**

Grave of adult male c. 40-50, in wooden coffin (420) fixed with 16 nails - only the nails survive with traces of wood adhering to a number of them, otherwise the 'coffin' was only discernible by a noticeable variation in the grave backfill (422). The skeleton itself was on a W-E orientation lying supine but in v. poor condition (ref. 421).

  - Cuts:
  - Fill of:

- **Level**
  - Relationships uncertain

**DESCRIPTION (See check lists):**

1. friable
2. brown
3. silty
4. 10% large flint, 5% small frag of chalk
5. approx 0.4m
6. approx 8 x 5m (not including what may lie under baulk)

**INTERPRETATION/DISCUSSION**

Soil spread overlying small area against the northern baulk of site. It overlies the possible northern cremation boundary ditch and possibly some gravel. Layer thinned revealing E-W ditch relaying of group 450 (ft 12) + two further E-W boundaries, groups 1318 + 1352. Layer appears to represent the result of 18th terracing.

New Forest ware drinking vessel recovered from grave group 423. Located over conjectured location of right hand - may have been placed in hand prior to burial. Impossible to establish with any certainty as hand not present. It is possible that the vessel had been placed on top of the coffin as it lay c. 0.1m above the remaining long bones of the skeleton (421).

Finds (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

Soil description (see Context 471)

**ADDITIONAL SHEETS:** ONE

**GROUP 535**

Additional description:

This skeleton was disturbed by grave cut 447 and interment of SK 435 - SK 434 was packed along the side of SK 435 recorded by geo-rectified photos.

Interpretation:

SK 434 was intered first, later disturbed by 435 but re-deposited 435's skull to left side of 435's head + long bones bundled together along 435's right lower leg - 434's left lower leg + foot in situ undisturbed.

Recovered in situ undisturbed.

- **Hyoid bone:** None
- **Sesamoid bone:** None

**STRATIGRAPHIC RELATIONSHIPS**

</table>

**Interpretation/Discussion:**

Originally thought to be coffin stain. Upon further excavation the coffin (442) was preserved and follows the inner edge of this deposit. This may indicate that this is backfill that has settled differently round the outside of coffin. Possibly upper edge of coffin - collapsed outward. (Overlay plans 213 and 268)

Condition Moderate

Plan No(s) 205

Posture Flat on back - skull to left

Section No(s) 107

Coffin No remains

Co-Ordinates Coffin fittings

Samples 14 Fe Nails 1020, 1028, 1040 → 41

1046, 1081 → 82, 1096

271 274

272 275

273

Soil description (see Context 418)

Additional description

The larger bones of skull, humerus, radius, ulna, femur, tibia remained in good preservation. Other bones decayed/decaying

Interpretation

Grave remained undisturbed with no truncation.

Preservation varied and all bones had adopted a bright orange colouration - possibly due to the absorption of leached iron minerals

GROUP # 840

Vertebrae in poor condition.

Some bones of right hand remained.

Hyoid bone X

Sesamoid bone X

**STRATIGRAPHIC MATRIX**

Eastern boundary ditch of cemetery.
Six phases of activity have been identified as follows:

**PHASE I** - Excavation of ditch, deposition of neonate burial group 1725, primary slump/siling
(1658, 1662, 1715, 1862, 1863).

**PHASE II** - Main phase of siltling comprising old topsoil and chalk eroded from the ditch edges

**REF. SECTIONS 271, 278 + 279 AND MATRIX**

1. **MAIN 'PRE-BORAL' DITCH FILL, INITIAL 'SILTING' PHASE COMPRISING OLD T/SOIL + CHALK ERoded FROM DITCH EDGES**
2. **POSSIBLE TURF LINE SEALING CREMATION(S) SOUTH OF GRAVE GROUP 1379 (SLOPING FROM N-S)**
3. **? UPCAST FROM GRAVES (REF. SHEET #)**
4. **UPPER FILL DIFFERS FROM ? UPCAST - NATURAL SITING?**
5. **TURF LINE?/ NATURAL SITING NORTH OF GROUP 1379 SLOPING FROM N-S, PETERS OUT BETWEEN Q, 1828+ 1379**
6. **? UPCAST, SIMILAR TO BUT EARLIER STRATIGRAPHICALLY THAN 3.**
7. **PRIMARY & SECONDARY SULTS/SLUMP ALONG EASTERN EDGE OF CUT**
**Features Truncating Ditch Group 450:**

- Cremation Groups: - 1721, 1786
- Grave Groups: -(S-N) 1719, 1175, 1280, 1323, 1305, 1310, 1340, 1412, 1451, 1460, 1379, 1395, 1336, 1464, 1567, 1528, 1601, 1866, + several North of Group 1601 including 1785 + 1690
- 'Pits': - 1671, 1823, 1816, 1905

**Features Truncated by Ditch Group 450:**

- Gully Group 470

**NB:** Burial Group 1725 appears to be a *Neonate Inhumation in the base of the ditch*
(CONT. FROM CXT SHEET)

PHASE III: – Cremation groups 1724 + 1786 cut through ditch silts

PHASE IV: – Possible turf layer(s) form over ditch silts (1845, 1663, 1716, 1802, 1891, 1864). It is possible that deposits 1809, 1842 + 1865 and 1822 also represent a turf line to the north of group 1879. It seems more likely to be natural sifting underlying the grave upcast (ref. PHASE V). Unfortunately, the relationship between these two groups of deposits has been truncated by groups 1879 and 1175.
(cont. from Sheet 3)

PHASE 6: - Graves excavated through silts and turf line(s) and upcast fills ditch to at least top of chalk. The graves were still visible within the potential upcast. (Although potentially not cutting this deposit, the variation between the backfill and the remaining upcast was sufficient to identify graves within the latter). This "upcast" peters out to the north of group 1866, and overlies the silty deposit(s) likely to be natural silting (ref. PHASE IV). It is possible that the northern end of the ditch has completely silted up prior to the excavation of the graves and that the remaining southern extent "backfilled" with upcast from the same ??

A number of pot sherds from what appears ->
to be 2-3 vessels were recovered throughout the "upcast." These may represent truncated cremation vessels cut by the graves ??? (ie. 1785).

**PHASE VI**: Pits of uncertain function truncate upper ditch fill ("upcast") in southern end of ditch (and, by implication, also cut grave backfill). At least one cremation (group 1724) is also truncated by these pits (pit 1677).

Excavation methods, lighting, conditions:

- damp, travel

Recorder: LN

Date: 21/11/03

Initials
When the skeleton was lifted, fragile bones like the ribs and sacrum broke. The left radius and ulna also fractured. When the cranium was lifted there was a hole on the right side caused by it lying on a stone and the subsequent pressure from above.

- A single hobnail (SF 1304) was found resting on the sternum. Although in an appropriate position for a pendant it was felt that it was more likely to have fallen through from the hobnail shoe (SF 1192) present in the overlying grave (grave group 485). However, when the right hand was lifted (which had been positioned in a gripping position) another hobnail was found in his hand. Perhaps SF 1304 was a pendant after all.

- Two left metacarpels were taken for DNA testing.

Two rafts (SF 1193 and 1194) have been allocated to this skeleton's grave, but none belonging to grave group 485 which overlies this grave. The finds seemed too low for 485 but too high for group 486. Either they belonged to...

With the samples, the abdomen sample may contain evidence of the left hand as it looked like the ulna and radius were lying across the torso. No neck sample was taken as the skull was very fragmented and was covering the neck area. The 'neck sample' is therefore within the head and chest samples.

**Oxford Archaeology**

**Context No. 459**
Description (See check lists):

Group # for a series of pits which form one of the first phases of eastern boundary for the cemetery complex. All the pits investigated were cut by groyes & filled with a homogenous dark brown silt clay with frequent flint nodules. The east southern pit in the 2003-4 L.O.E. in cut by boundary ditch group 450 - this relationship was identified during the 1960-70s excavation data. The alignment of the pits - which would have formed a positive boundary/hedge - mirrors that of gully group 470, which also predates the outer boundary ditch group 480, therefore suggesting a level of association even though no physical relationship between both groups exists.

3. CLAYYISH Silt 4. FREQUENT SMALL CHALK 5. OCCASIONAL SMALL FLINT
6. 1.3m X 0.4m 6. LESS THAN 0.2m 8. TRAVEL DAMP/WET

Interpretation/Discussion

DEPOSIT FORMED REGULAR EDGE PATTERN WITHIN THE GRAVE. POSSIBLY EVIDENCE FOR Coffin Lid/DECORATION. No SE to SUPPORT THIS. POSSIBLY DIFFERENTIATION IN BACKFILL - PATTERN A COINCIDENCE. BUT THE PATTERN DOES WE DIRECTLY OVER AREA OF COFFIN. THE CURVILINEAR PART 1m FROM DP 213/1 IS MOST CONVINCING AS VERY SIMILAR COLOUR TO (492).

**Description (See check lists):**

**GROUP NO. FOR GRAVE CONTAINING V. POORLY PRESERVED SKELETON OF A CHILD c. 6 YRS.**

**CUT [406], BACKFILL [407], POSSIBLE COFFIN STAIN [408], SKELETON [436].**

**No other than a cluster of hombals around the feet.**

**SKELETON [436] 488 Coffin Stain**

**Interpretation/Discussion:**

Shallow grave with skeleton of a young child, c. 6 yrs based on tooth eruption dates. Map in the ground. Mandible v. poorly preserved, and crumbled on lifting. Ribs and spine, arms did not survive, but some traces were present in the form of stains in the grave fill.

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

- **Small Finds**
  - Hombals:
  - Coffin nails: 1099-5, 1099-7, 1099-8, 1099-9
- **Samples**
  - Sample Code: 204 -> 230

**Recorder**

**Date** 14/11/03

**Initials**
Dark brown deposit with light brown orange inclusions which in possibly wood indicating the presence of a box or wooden structure. The width & depth of this deposit is approx 50cm however it appears to extend around the circumference of the urn.

Interpretation/Discussion

Possibly a box surrounding the cremation urn; although some present in the deposit, heavily degraded box is also present in this deposit.

**Description (See check lists):**

N/S gully - terminating to the north. Represents a form of cemetery boundary which pre-dates ditch group 450. The northern terminal post likely held a post and was a part of access to group 4 from the cemetery complex. If removed or group sheet 460, the alignment of the gully mirrors that of Hodges's 460 suggesting an association by phase.

**Description (See check lists):**

**Small Find** 1097

**Artifact is a Bone + Fe Piece. Located on Lower Neck Area.**

**Water chest of sk (435) recorded in situ + lifted in 6 pieces.**

**Survived in a 'V' shape, open end towards the head. Looks to be a neck pendant of sorts. The bone was 2 layers with the exterior layer (outer) made up of small square cut pieces of bone pinned to the back plate with small Fe tacks or pins.**

**The iron is exposed on both interior + exterior surfaces.**

**Sketch not to scale:**

- Int/Ext - Bone + Fe Necklace/Pendant.

**Description (See check lists):**

1. Rectangular
2. Almost vertical sides, flat base
3. Length 2.85, width 0.87 - 0.7m
4. Depth 0.64m
5. See additional sheet.
6. 470, 476, 499
7. Grave cut, vertical sides.

**Interpretation/Discussion**

A grave cut containing a male skeleton. The grave cut has almost vertical sides. The stability of the sides increases with depth. Here the natural chalk is unweathered and harder.

**Description (See check lists):**

Skeleton 441 placed within grave cut [417] and burned beneath backfill deposit (418). 14 Fe nails were recovered. The bones preservation varied with many of the larger bones remaining intact and the vertebrae, pelvis and other small bones either completely decayed or degraded.

**Interpretation/Discussion**

The skeleton lay in a grave cut measuring 2.20m length, 0.80m width x 0.85m depth and was buried beneath a mixed deposit of clayey silts and chalk debris. No truncation by later grave cuts were present and visible signs of disturbance/intrusions were not observed.

**Description (See check lists):**

Single episode of backfill comprising:
- Re-deposited chalk with occasional flint nodules; mixed with a low percentage of clay silt
- Depth 0.05m → 0.17m max

**Interpretation/Discussion**

Backfill of grave [478] - re-deposited chalk mixed with a low amount of the sub-soil/topsoil impacted when the grave was dug.

DESCRIPTION (See check lists):

Grave for grave + fills
skeleton 476 placed within
grave cut 472, and then
back under fill 474. A coffin nail was found.
The bones of SK 476 were generally well preserved,
with only the left rib case, most of lower vertebrae
and part of pelvis + sacrum being missing.

INTERPRETATION/DISCUSSION

The skeleton lay in a grave cut measuring
2.06m in length, and 0.87 - 0.67m wide, with
depth at 0.64m. No truncation by later grave
cuts was present, and no signs of
visible disturbance or intrusion were detected.

**DESCRIPTION (See check lists):**

1. SOFT
2. LIGHT YELLOWISH GREY
3. CLAYEN SILT
4. OCCASIONAL CLOAK UP TO 0.02 M IN CAVITIES + AIR POCKED (POSSIBLY SURROUNDING DEPOSIT)
5. 0.25 CM THICK
6. 1.7 M X 0.55 M. THE DEPOSIT IN PLAN WAS 0.1M WIDE STRIP, BUT IT DID CONTINUE BELOW THE SKELETON.
7. SUBSTANTIAL POST INTRUSION
8. BY TROWEL IN DAMP/WET CONDITIONS.

**INTERPRETATION/DISCUSSION**

COFFIN WITH PRESERVED WOOD IN SITU.

THE WOOD WAS ROUGHLY IN THE CENTRE OF THE DEPOSIT WHICH IS APPROX 10 CM WIDE. THE WOOD IS EXTREMELY FRAGMENTED BUT FORMED A STRAIGHT LINE BETWEEN COFFIN NAILS.

THE SOUTHERN EDGE WAS BETTER PRESERVED THAN REST OF COFFIN AT A HIGHER LEVEL. FIRST THOUGHT TO BE BACKFILLED BONE RUB.

UPON EXCAVATION OF COFFIN NAIL (1392), IT FORMED A STRAIGHT LINE.

**Additional Sheets:** 2
THE PIECE OF PRESERVED WOOD ON THE NAIL (1392) TOUCHED AND DISCOLOURED A PIECE OF THE PRESERVED COFFIN WOOD, ON THE SOUTHERN EDGE. THE COFFIN NAIL LAY WITHIN THE GREYISH DEPOSIT. IT IS THEREFORE POSSIBLE THAT THE DEPOSIT IS THE REST OF COFFIN WOOD THAT HAS NOT SURVIVED.

THE COFFIN WALL SURVIVES TO A DEPTH OF 0.25m. IT IS HELD IN PLACE BY DEPOSIT AND GAYATRIES. THE SOUTHERN EDGE IS STILL IN SITU. THIS HAS BEEN RECORDED IN SECTION / SLR SHOT / DIGITAL SHOT (SECTION 139; SLR F29 (1-6); DIGI SHOTS 88-9; 98-100.)

IT HAS NOT BEEN ENVIRONMENTAL SAMPLED BUT LARGER PIECES HAVE BEEN KEPT FOR SPECIE ANALYSIS.

PIECES OF WOOD FOUND AT W. END (HEAD) WERE SLOPING IN TOWARDS THE SKELETON SUGGESTING IT HAD BEEN PUSHED/COLLAPSED INWARDS. THIS WAS EVIDENT IN PLAN AND THE ANGLE OF 131° WOULD SUGGEST THE COFFIN COLLAPSED IN THIS NW CORNER.

THE NORTHERN EDGE OF THE COFFIN WAS POORLY PRESERVED, LARGE
Quantum of wood fragments found within the backfill (140)
Over the skeleton along this edge. The foot of the coffin
was not preserved either small pieces of wood and a
continual line of staining was found along these edges.
Uppermost layer of coffin nails survive in situ (due to
alignment with preserved wood e. g. 1392) as do the lowermost coffin
nails. All lie within the coffin stain/preserved wood
outline.

Working shots of coffin and skeleton in situ. (Film 29 or 30?)

**Description (See check lists):**

Interpretation/Discussion

New forest acorn drinking vessel from grave group 490. Positioned outside coffin in N-W corner of cut 484.

Smaller but otherwise "identical" to vessel recovered from grp. 423 to the north-west.

**Finds** (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

- Fill of: 1473
- Relationships uncertain

**Description (See check lists):**
1. Fissure.
2. Wood dark brown.
3. Silt
4. Chalk > 30%
5. 0.40m excavation
6. 1.70m in plan
7. A darker stain is within backfill 476, this potentially represented a coffin stain.

**Interpretation/Discussion**
A darker semi-rectangular fill that initially was thought to be a coffin stain within the backfill, however its shape does approximate with the location of the skeleton, but coffin nails indicate that the coffin was larger. Therefore this is possibly not a coffin stain, but may relate to the decomposition of the corpse.

Grave Group containing Grave Cut 431

Skeleton 491

Backfill 432

Hot nails 401

Coffin nails 1074-1075 1076-1077 1078 1085 1092-1095

Description (See check lists):

Grave Group

(401) backfill

Coffin (508) - (491) seen

[431]

(401)

When coffin was discovered it was believed to be animal bone. It was given a small find number 1076. Now it has been identified as wood. It has been given a context number 508.

**Description (See check lists):**
1. Sub-rectangular
2. Flat base with shallow undulations and relatively imperceptible sides
3. 1.80m length x 0.40m width x 0.05m depth
4. See rectified photo sheet 447
5. Heavily truncated by machinary

**Interpretation/Discussion:**
Poorly defined grave cut with only the very base - 0.05m depth - remaining. The visible width of 0.40m is likely to be misleading and a generally wider grave cut would have been excavated. The length is also approximate because machine truncation has erased visible 'cut' traces at each end.

**Description (See check lists):**

1. Compact
2. 0.05m Thickness
3. Variable concentrations (20–40%) of angular chalk fragments
4. Covered base of grave
5. Leaf-travelled excavation. Wet/dry conditions

**Interpretation/Discussion:** Mixed soil matrix of former top soils and unweathered chalk fragments from the bedrock mantle. Only 0.05m thickness remaining due to machine truncation and the bones of the skeleton becoming visible at the surface. No unusual characteristics observed and considered to be a general grave backfill.

**Description**

A SMALL ASSEMBLAGE OF COFFIN WOOD AT EASTERN EDGE OF GRAVE CUT.

**Discussion**

PART OF GRAVE GROUP 507.

THIS WAS ORIGINALLY BELIEVED TO BE A BONE ASSEMBLAGE + WAS GIVEN SMALL FIND NO. 1076.

UNFORTUNATELY THE貨 WENT BACK TO THE UNIT BEFORE IDENTIFIED AS WOOD.

THUS, SMALL FIND 1076 IS COFFIN CONTEXT (508)!

**Description (See check lists):**

Skeleton 477 - placed within grave cut 501 and buried beneath backfill deposit (502). Skeleton levels 232/11-14

**Interpretation/Discussion**

Skeletal remains of a child with an approximate age of 3 yrs ± 1 - undetermined sex. Remains became visible after the machining of modern foundations. Bone preservation was very variable but overall poor. Small fragments of iron coffin nails were recovered.

**Description (See check lists):**
1. Freide
2. Mottling of light brown + white
3. Clayey silt + chalk
4. 0.75m Thickness
5. 50% chalk fragments. Occasional flint fragment.
6. Fills full extent of grave.

**INTERPRETATION/DISCUSSION**
Mixed deposit of former top soils and chalk bedrock backfilled within grave cut and covering skeleton 522. Several fe. coffin nails were recovered.

ADULT SKELETON RECORD

SITE CODE AY21
SITE NAME LANKHILLS
Fill of 519
Completeness ~90%
Orientation NW - E
Condition Good
Posture Supine

Plan No(s) 251
Section No(s) 129 146

Coffin No (but nails remained)
Coffin fittings

Soil description (see Context 521) Generally a mixed deposit of former top soils and chalk bedrock fragments.

Additional description Skull relatively complete although fragmented. Most other bones remain in fairly good condition.

Interpretation Coffin burial placed with head to the west - left lower arm laid over pelvis - right hand resting on right thigh. Head turned toward north.

GROUP 570

Hyoid bone
Sesamoid bone

Description (See check lists):
- Fairly loose fill of backfilled chalk
- Natural, mixed with brown-grey silt clay
- 2.5 m x 0.60 m, 0.12 m deep & max.
- Dug by hand in the rain.

Interpretation/Discussion:
- Backfill of Roman grave.
- The spindle whorl was uncovered during initial machineing of site.
- So an exact location is not possible, but was definitely from this fill.

#### Description (See check lists):

No. for coffin containing SK 527.

No stamping was visible, possibly due to the extreme truncation of the grave. The presence of a coffin is seen by coffin nails. The approximate dimensions of the coffin are 1.80 m x 0.45 m.

17 nails were recovered from this coffin.

#### Interpretation/Discussion

Coffin.

**Interpretation/Discussion**

Judging by the shape of this grave in plan, it appears likely that Grave [533] could well have almost completely truncated another earlier grave. At the time of digging, the earlier grave would have been left as a small amount of backfill in situ which may well have collapsed into Grave [533]. This collapse would most likely have then been removed and cleared leaving this unusually shallow grave cut. Backfill (534) contained residual neonate cranial bones which may have been the remains of this earlier grave — stated confidently yet further excavation is required.

Context No. 534

SITE CODE AY 21
SITE NAME LANKHILLS

(534) contained neonate cranium and it appears residual because it was discovered at both abdomen and foot of SK 566. It is likely that this material originally came from either grave [624] or [628], as these graves are truncated by [533] which contains (534).

I think it unlikely that this neonate was originally buried with male (566) as it appears to have been disturbed to much + no other bones survive.

The most likely candidate for neonate burial is [624] as this is the most recent grave prior to [533]. All others would require more chance for material to survive.

---

**Diagram:**

- [533] Contained residual neonate cranial bones.
- [624] Heavily truncated no original fill extant. Neonate possibly associated with one of these.
- [628] Heavily disturbed / no material.
- [626] Heavily disturbed no material.

**Description (See check lists):**

- This context is for Grave Group.
- **469,** (47), Sk 434.
- SF's: in situ coffin nails Fe-
  - 1059, 1056, 1127-1129, 1144
- **Samples:** 322 + 324

**Interpretation/Discussion:**

This grave was heavily truncated by Group 530.

All that appears to be insitu undisturbed are the
lowest nails + the lower left leg + foot. The rest of
Sk 434 has been redeposited along the side of Sk 435
Group 530. Group 535 is the earlier grave.

| 400 |   |

This context is 542

| 542 |

**Description (See check lists):**

1. Fairly loose, light grey-white chalk with patches of light brown-orange silt.

Few inclusions, some are fragmented chalk, occasionally found large flint nodules, 10-15cm diameter.

L = 2.80m, B = 0.87m, D = 0.88m

Excavated in May, may be in wet weather.

**Interpretation/Discussion**

Grave Backfill.

3) Length 2.19m, width 0.80m, depth 0.85m.
4) See additional sheet.
5) Truncated by modern building concrete.
6) S54, SK S53.

Interpretation/Discussion:
Regular shaped grave cut into natural chalk, largely vertical sides. Back filled with natural chalk + small amounts of soil, sometimes hard to differentiate from natural chalk. The upper part or cut was truncated by modern building concrete, however, the skeleton in the lower part of the cut was unaffected by this.

Description (See check lists):

1. sub rectangular
2. flat base (sides truncated)
3. width approx 0.7m, length approx 2m (of which approx 1m is still in situ) depth unknown. 0.10-1.0m surviving depth
4. see add sheet
5. heavily truncated by modern soak away

Interpretation/Discussion

Grave cut roughly N-E aligned which contained one adult skeleton. It didn't contain any evidence of a coffin, but has been very heavily truncated, once at the pelvis area by a modern soak away, but also the top of the grave (including the feet) and damaging.

**Initials**

---

**Notes**

- Group 605
The lone metacarpel has been taken for DNA testing.

Only one sample has been taken, that for the abdomen. It is possible that fragn of the hands may be found in this sample as it looked likely that the hands were originally positioned on the torso.
### CONTEXT RECORD

**SITE A421**

- 513 - Grave Cut
- 514 - Grave Backfill
- 529 - Grave Backfill
- 537 - Coffin
- 559 - Skeleton
- 568 - Vessel

**Interpretation/Discussion:**

W-E aligned grave of ?adult male truncated by group 580. However, even where not truncated by group 580, the skeleton (559) has been re-deposited within the coffin (537) with the exception of the left arm, pelvis, leg and both feet which remain in situ, together with a shallow bowl (568).

**Recorder:** PB

**Date:** 26-11-03

**Initials:**
Additionally, although displaced, certain parts of the anatomy appear to have been at least partially articulated when redeposition occurred (i.e. skull, mandible + vertebrae and the left arm).

It seems likely that the coffin associated with this burial was still partially intact during the excavation of group 580 and that the disturbed remains were pushed to the back (i.e. south) of the still existing void. This is also suggested by the distinct variation in the general backfill of the grave: where the in-situ remains and redeposited remains are overlain by a deposits similar in composition to 514, where no remains survive in situ, the base of the cut is overlain by a more organic mid-brownish grey silty silt 529. A human femur, probably from group 565 was recovered from the upper backfill (514).

Fill of: 561

Matrix location: Relationships uncertain

Description (See check lists):
Upright complete flagon placed just outside the coffin (564) on the base of grave (567) on the western side.
The vessel is ceramic with a black slip. On the shoulder of the vessel is applied decoration.

Interpretation/Discussion:
Grave good - flagon

SITE CODE: AY21
SITE NAME: Lanchills

Fill of: S61
Completeness: 10%
Orientation: E-W
Condition: Poor to poor
Plan No(s): 278
Posture: Feet decumbent
Section No(s): Coffin
Coffin fittings: William adult coffin S64

Soil description (see Context S63)

Skull fragments & vertebral elements of a very young infant.

Additional description:
Possibly a newborn / late foetus. However, in the absence of
tooth or long bones this cannot be confirmed (based on skull only)

Interpretation:
The infant lies in the SE corner of Coffin S64 (the coffin of
an adult female (16-31y) to the R of her R foot. The skull appears
to overlie the bones of 2 adults. It is possible that this represents a
stillborn or neonate who died soon after birth. It is very possible
that S62 was her mother

**DATE:** 26.11.03

**INITIALS:**
neck of a flagon, similar to that recovered from grave group 565. Re-deposited coffin nails (1357-62 + 1458-60) were also recovered along with a small amount of charred. It would appear that the burial + coffin within group 560 were still "in-tact" when this grave was dug and the contents largely re-deposited within the coffin (537) of burial (grp.) 560 (ref. 560).

The vessel(s) may have belonged to group 560 although this did contain an in-situ vessel (568) and it is possible that they originate from an earlier grave (grp. 555) truncated by grp. 560 and/or the adjacent grave excavated by Giles; the relationship between the previously excavated grave + groups 560 + 555 is uncertain.

NB: - SF's 1357-62 + 1458-60 ARE NAILS FROM ADJACENT, TRUNCATED

Description (See check lists):

449 - Grave cut
451 - Skeleton
452 - backfill

Interpretation/Discussion

We aligned inhumation of a large adult male. Although no number allocated for a coffin its presence is apparent due to 16 coffin nails. Two of those nails are suspicious though and may belong to grave group 585 which truncated grave cut 449.

Finds (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

Recorder LN
Date 24/11/03

but didn't seem to affect the rest skeleton. The two nails are 1193 and 1194, 1154 and the suspicion arose as they seemed to be too low for grave group 655 but too high for group 680. They have however been allocated to group 680 due to the assumption that they were stuck due to 1193 pointing down (away from the upper grave).

Two hobnail shoes 1298 were placed in the grave but outside of the coffin.

Two single hobnails were found within the grave. One, 1304 was resting on the skeleton's sternum. The other, 1322, was clasped inside his left hand.

On site Osteological Assessment:

Sex: Pelvis 7 Greater Sciatic Notch: feebly marked (O2) 
- pubic auricular surface absent (O2) 
- auricular surface not traced 
- oblique sinuum intermediate.

Cranium: Posterior process large (O2) 
- supra-orbital ridges (O2) 
- orbital ridge not fully blunt (O2) 

Age: Auricular surface - very evident, transverse organization 
- young individual (14-17y) 
- proximal radius unfused, ulna cortex unfused 
- femur & humerus epiphyses unfused 
- dental attrition: M1 =< 15-29, M2 = 16-20y
- two left metacarpals have been taken for DNA testing.
- The backfill directly surrounding the body was quite grey and silty. It is not clear what caused this, it could be just a natural discoloration, but one suggestion has been it is gypsum, used by the Romans as a preserving means.

**Description (See check lists):**
- Soft, mid-greyish brown, silty clay.
- Occasional peat, 0.3m thick.
- 1.75m x 0.4m, a strip 0.86m wide.
- Continuous line on W, S, E edge, broken on N edge.
- Trowel and mattock in wet conditions.

**Interpretation/Discussion:**
- Coffin stain, quite dark discolouration, preserved wood fragment but none left - too fragmentary.
- Coffin nails survive in situ within the coffin stain.

Matrix location

Relationships uncertain

Description (See check lists):

Skeleton 554, placed within grave cut (552) and buried beneath backfill 553.

This context is

Skeleton 554, placed within grave cut (552) and buried beneath backfill 553.

More notes were recorded. The general preservation of the bones is fairly good. The grave cut was 2.4m long, width 0.80m and depth 0.35m, no grave goods other than coffin nails were found.

The grave cut was traced at the eastern end by modern concrete, however this had not affected the skeleton, which was partially underneath (legs).

The grave (552), is cut of cuts (773), however due to concrete above, the relationship in plan is not possible to see, and thus, the true relationship is not possible to know.

**Description (See check lists):**

556 - Grave cut

557 - Skeleton

558 - Back fill

---

**Interpretation/Discussion**

Grave cut roughly W-E orientated and containing one adult skeleton. The grave has been heavily truncated removing any signs of a coffin and the entire upper body of the skeleton. Aging and sexing was therefore not possible.

Brave cuts also bear indicators of heat altering temperatures. The bone is burnt, white with blue green discoloration but Fe coffin nails are normal - unaltered and there is a distinct lack of charcoal, assume the coffin was burnt.

How do you get heat altered surroundings with intact coffin, no charcoal + a burnt articulated skeleton?

SK 617 was collected as part of 100% sample of (607). In the hopes more of skull could be recovered by lab. Collected as sketch below.

Note SK 1568 is bone of (Sk 617) - misidentified as Cu. Earlier.

### Description (See check lists):
- Burial group compound of coffin (S62) (S61), cut into grave or grave fill.
- 2 necrional footed vessels (S74) (S16) cut into grave or grave fill.
- Adult: male, containing partial female.
- Joined with coffin outside coffin to the west of coffin stand in a flagon. The adult was provisioned with 2 horizontal data. She was not wearing them at time of burial. The body overlay a part of one foot. The infant/infant had been placed on top of the 2 boots.

### Interpretation/Discussion
- Burial Group
- Ostensibly Christian W/C burials but with grave goods.

### Interpretation/Discussion

- **This grave hardly exists after truncation**
- **And thus no dimensions are available**
- **Extent unknown, however depth = 0.53m**
- **Truncated by [533]**
- **No fill numbers**

**Grave [624] appears to have been almost completely truncated by grave [533]. The partial remains of the backfill appear to have compacted into grave [533] and been cleared out prior to the burial of skeleton (626). This material may well have then become incorporated into the backfill of grave [533].**

**Description (See check lists):**

This context is for Grave Group.

- **Context Type:** Deposit/Cut/Structure
- **Overlain by:** 400
- **Cut by:**
- **Replaced by:**

- **Co-Ordinates:** Consists of: `[S441/S446] + SKELE 547
- **Level:**
- **Butts:**
- **Cuts:** 400
- **Nails:**
- **Samples:** Head, neck + chest, abs + hands, feet.

**Levels were not taken because EDM was being exchanged due to breakdown.**

**Interpretation/Discussion:**

This Grave Group truncates an unnumbered unsurveyed grave cut in its NW corner.

SKELE 547 is very poorly preserved.

9.  

**Stratigraphic Matrix**
- [627]  
- [626]  
- [401]

**Interpretation/Discussion:**
Grave cut [626] has been identified as such due to the clearly grave-like shape in plan, and sharp vertical edges in places. However, a great part of the grave cut has been extensively destructed and modified/undercut by what appears to be the actions of rabbits. The natural around this grave is heavily modified and loose and the edges are now irregular and undercut. Moreover, there is no evidence for any burial. Either no burial was intended or rabbit activity has obliterated all trace. It may have contained a cremated burial, as a cremated cranium was discovered in a residential area.

Capacity within the backfill (534) of grave (533). This material at first appeared to be localised to the abdominal area of skeleton S66 and therefore original interpretations were of a pregnant woman in grave (533). However more neonate cranium was found near the right foot, and the skeleton was male. Therefore this neonate cranium has to have come from an earlier + truncated grave. It may be that this grave (626) contained this neonate, however it is equally likely that it came from one of two other graves which are truncated by (533) – these being (624) and (628). It is likely that it will remain impossible to say where this neonate cranium originally derived from as both (624) and (628) contain no skeletal remains whatsoever. Thinking about it, it is probable that this grave (626) did not contain the neonate because (533) does not actually cut (626)!

It is less likely that the neonate was in this grave as it is not actually cut by 533. It would have to be residual residual!!

```

**Interpretation/Discussion**

This deposit appears to have been heavily modified / disturbed by rabbit activity. The patches of dark blown look like disturbed top soil. No skeletal material was retrieved from this deposit. Whether it originally contained a burial is a moot point.

Interpretation/Discussion

Grave backfill - heavily modified / disturbed by rabbit activity.

The patches of tossoil may suggest this activity. No skeletal material what -

sogre was retrieved - this may mean that no burial in fact took place, or

if it did rabbit activity has obliterated the evidence. Also no coffins can be

suggested as rabbits would be unlikely to eradicate all coffin nails.

**Description (See check lists):**

- Sub-rectangular outlining seen directly above the step in the grave sides.
- 2.40m E-W, 1.3m N-S.

**Interpretation/Discussion**

This was originally assumed to be a stain from a large coffin. On further excavation this was not the case, as a lead coffin stain was seen lower down. **This may be the remains of a wooden lid, which rested on the ledge formed by the step in the grave sides.**

**Initials:**
This group is overlain by Modern Overburden/Make Ground and truncates Group 665.

The grave is rectangular with an upper fill containing 2 broken pottery vessels (604), (606) Also a fragile horse skull (603) These were recorded on Digital #130 - PB280006.

Below these the fill changed to an evenly burned layer. The skeleton (617) was semi-articulated yet burnt in situ.

Not much ash/charcoal but bone burnt throughout. There was also 35-45mm (of surrounding base + edges of cut) thick heat altered + colour changed soils + stones of surrounding deposits.

Curious deposit. For Sk. 617 - 100". Sampled + divided into sections to see if remains were anatomically correct. Curious because no coffin and not much char for indicating in situ burning, yet the surroundings have been heat altered and couldn't be just dumped because Sk. looks intact in situ?

**DESCRIPTION (See check lists):**

1. Irregular
2. Concave base - irregular sides - irregular profile
3. Length = 1.10m Width = 0.85m Depth = 0.18m
4. Transition only by modern stripping
5. Irregular - unlikely to be grave - purpose and use unknown. Underlying on certain levels may be early disturbance.

**INTERPRETATION/DISCUSSION**

Highly irregular negative feature - purpose unknown

- The natural chalk around this feature is extremely loose and also discoloured - this may suggest the cut is natural and highly turbid - this feature is potentially a tree throw. However, the material appears similar to grave fill but no finds and no distinct grave shape or profile. - in plan this feature appeared more regular and was assumed to be a grave. However, at this point this appears extremely unlikely.

**Description (See check lists):**

1. **EXTREMELY LOOSE**
2. **WHTISH GRAY / PINK**
3. **Composed Primarily of Chert / Chalk**
4. **OCCASIONAL FLINT**
5. **0.18 M**
6. **LENGTH = 1.10 M \ WIDTH = 0.85 M**
7. **Similar in Appearance to Grave Fill, However Not in Association with a Grave Cut**
8. **Excavated by Trowel**

**Interpretation/Discussion:**
The colour of this deposit in plan along with the apparent regularity of the cut in plan led suggestions that it was a grave. However, the last ex-irregularity of the cut, the lack of any skeletal material, or indeed anything would suggest otherwise — it is most likely that this material has become incorporated into a pre-existing natural hollow seen at a tree throw.

Recorder: LN
Date: 10/12/3
grave groups 770 and 800. It has slightly damaged skeleton 741 with 770 to have disturbed some coffin nails.

Two hobnail shoes, 1801 and 1802, were found resting under the feet. They were still in situ (see plan 340) and appear to have been placed the wrong way around (i.e. left shoe under right foot).

### Description (See check lists):

This ctx is a reference for a human skull redeposited in grave fill (677) of [674] along the south edge in towards the eastern corner of grave cut. Skull orientation likely (heavily crushed) upright with vault aligned NE-SW no orbits surviving. Ress from earlier heavily truncated grave cut [682].

### Interpretation/Discussion:

Redeposited human skull.

One of three recovered from immediate area.

**Description (See check lists):**

Group No for grave cut 621 + fills 622 ad Sk 623. A short male skeleton, dated on site to between 35-45 years old with well worn down front teeth. No coffin nails found. shallow grave cut. Grave cut without earlier grave excavated in 2008. Found in a square grove. Fairly well preserved. Also includes 7013 + 7006, which see plan 329. Was thought to have been an earlier grave cut - cut by 621. However its close location to a grave cut (see plan 329, excavated in 2008) makes me think that it is part of this or no skeleton was found.

Soil description (see Context 699)

Additional description:
Any badly preserved skeleton only the cranium and a fragment of left femur remain. Some tiny frog may be found within the samples. Samples were taken.

Interpretation:
SW-NE aligned female skeleton in a coffin. An iron object (possibly some shears) was found in the approximate position of the lower left arm. On the underside (see add sheet).

- 1607 (Hobnails)

**Samples**
- 1735
- 1734 (Glass)

**Recorder RB**

**Date 3.12.93**

**Initials**
Fragments of glass (1734) and an additional fixing nail (1735) were recovered during the lifting of the skeleton - it is unclear whether the glass was part of an in-situ vessel or part of backfill (649); the remaining fill at the east end of the grave was sampled (S15).

Group 700

Approx. extent of coffin (651) based on location of fixing nails and variation in s/kill (649) (Ref. 649).
SITE A Y 21

Context Type: Deposit/Cut/Structure Cut

Description (See check lists):
1. Sub rectangular
2. Flat flat base, vertical sides, but in cut by 621
3. Length 1.95m, width 0.67m, depth 0.80m - 0.56m
4. Treated by 621, 6, 704, 7. Grave cut 701 is nearer than 621 and is the east part of a grave cut next to 621 to the south that was excavated in 2000.

**Soil description (see Context 6.19...)**  
Extended Supine Skeleton with both arms flexed, and hands resting over pelvis in traditional Christian gesture of repose. The depth of the grave (c. 145mm) may have contributed to some extent account for the good preservation of this individual.

Adult male (79/80) of robust build with marked muscle attachments, especially on the arm bones. Buried in wooden coffin (decayed) to ribcage bone.

**GROUP # 705**

Existence of coffin known only from faint brown stain on (619) overlying underlying & on either side of Side 702 on base of grave (618). carded by 11x nails in the corner and along long axis of coffin.

There was an exceedingly tight fit of coffin within grave so that limit of coffin stain could only be defined in plan at head 8 Bennam long axis with grate fills (change of colour).

**HEAD**

- pointing downwards [N]
- all coffin nails, unless otherwise indicated were pointed towards S on the horizontal plane.

**BASE**

- pointing downwards

Recorder: [Signature]  
Date: 9/12/03  
Initials: [Signature]
Description (See check lists):

1. Field:
2. Light chalky white + some gray
3. Approximately 30% back filled chalk + 70% grit + 10%
4. Some on 622
5. 0.30 - 0.56 m
6. 1.93 m

Interpretation/Discussion:

This fill (704) appeared to be undistinguishable from 621. The cut (704) was interpreted as an earlier groove below 621, however no skeleton was present, and its location (next to a groove excavated in 2005) makes us think that they may be the same. See Plan 704 vs 324.

Description (See check lists):
Narrow and very deep, W-E oriented grave containing a single adult male skeleton in good condition; coffin consisting of straw and二次元名前 . 11x11 nails and a group of hiramute (possibly a pair) placed at the foot end of grave outside the coffin. The hiramute are on a level higher than the skeleton on a level with upper coffin nails (pointing downwards) - suggestive that they were placed with the grave after initial back filling around the coffin had begun.

Interpretation/Discussion Grave Group.

**Interpretation/Discussion**

Bioturbation cut presumed to have been caused by rabbits. Animal activity heavily disturbed the burial resulting in the loss of most of the skeleton. Burrow also contained charred and crem. bone so it is assumed to have cut a cremation which was subsequently destroyed by later activity on site (ie construction of the school buildings)

Excavation methods, lighting, conditions
Planning of the Hobnails became difficult because their right foot had collapsed on top of the left foot. This made differentiation between right and left difficult. Also, feet collapsed together due to this problem. However, once lifted, the underlying clay was divided in two, thus separate samples for left and right feet.

The abdomen sample also contains samples for both hands as it was impossible to differentiate.

**Description:**

**Finds:** (tick):  
- None [], Pot [], Bone [], Flint [], Stone [], Burnt stone [], Glass [], Metal [], CBM [], Wood [], Leather []

** interception/Discussion:**

Grave of ? adult male, aligned W-E accompanied by coffin (781) which had substantial nos of fixing nails at either end but none along the sides (with the exception of 1937 + 1938). Preservation of long bones, skull, pelvis, lower vertebrae and feet reasonably good; no hand bones survive although a pile of 3 Cu. Alloy coins (1938 -1939) were recovered from the projected location of the right hand. P.J.O

**Finds (tick):** None [], Pot [], Bone [], Flint [], Stone [], Burnt stone [], Glass [], Metal [], CBM [], Wood [], Leather []
This grave truncates 2 others - Grp. 810 which it heavily truncates and 9.815 which it clips along the southern edge of 9.710 (9.815 only partially excavated as at 18.12.03).

Surprisingly, no channel was recovered from the backfill (779) of group 710, suggesting the skeletal remains disturbed during this burial have either disintegrated or been removed and placed elsewhere (see also groups 555, 560 & 580). A number of coffin nails (1957 - 1960) were recovered from within backfill (779) and probably originated from grp. 810, as did a possible brooch class (1985).

Bone comb 1973 probably belongs to group 810 given its location at the western (i.e. head) end of that group.

However, there is a possibility that it belongs with grp. 710 given its position on the interface between the two graves. P.T. O

**Grp. 815** (part-ex. as at 18.12.03)
The nails (1934, 1936, 2036) around and beneath the fibulae and fibia of skeleton (782) may represent in-situ (or slightly disturbed) nails from the coffin (786) belonging to group 810. As 810 is slightly deeper (c. 0.05m) than 710 - this may also explain the survival of the comb.

- Associated SF number(s): 705, 7096, 734, 7922
- Age: 40 - 45
- Sex: MALE
- Samples: 617 - 622

**Soil description (see Context 717)**: THIS GRAVE CONTAINED TWO TYPES OF SOIL: A LOOSE, SILTY BROWN DEPOSIT EXTENDING 1 FIDD, 8 CM BELOW SURFACE (401) AND A WHITE CHALK DEPOSIT ABOVE AND INCLUDING THE SKELETON/COFFIN (716).

**Additional description**:
- SKELETON WAS POSITIONED SOPINE IN AN E-W ORIENTATION WITH THE HEAD FACING TO THE NORTH.
- LEFT ARM AND LEG PLACED WITH FOREARM AND HAND ACROSS THE BODY (AS IS ANNOTATED BELOW).

**Interpretation**:
- ADULT SKELETON MALE, AGED 40 - 45. NO GRAVE GOODS WERE FOUND WITH THIS INDIVIDUAL.

### Interpretation/Discussion

We aligned inhumation of adult, sex indeterminate as only skull and partial leg bones survive.

Accompanied by wooden coffin with 16 fixing nails, traces of wood adhere to some of the nails.

Grave partially truncates "hedge line" at its eastern end.

**Soil description (see Context 719)**: LOOSE, MUCK BROWN, FLINTY CLAY.

**Frequent chalk, small-medium blocks, occasional flint medium.**

**Additional description**
Most of body removed by school trench. Skull very fragmented. (Possibility of skeleton lying on side, facing north.) No it is supine - found ribs side-on side of vertebrae.

**Interpretation**
Heavily truncated adult skeleton. **HIGHLY POSITION IN GRAVE OF UNUSUALLY LEFT OR RIGHT AND BONE IDENTIFICATION VERY DIFFICULT. QUITE TWISTED/SUBSIDED. SOME POSIBILITY DUE TO MODERN DISTURBANCE.**

patches seen). One small nail was found at the feet end of the coffin but doesn't seem to be a horn nail, perhaps it is part of the coffin decoration.

Also within the grave was an iron object which resembles a pair of shears. It was located by where the lower left arm is presumed to have been. On the underside of the shears are some fabric remnants.

1. Sub-rectangular.
2. Flat base, moderate break of slope, steep sides.
3. Length 1.18m, width 0.46m, depth 0.26m
4. See additional data. See below.
5. 732, **sk** 733.
6. By hand, good.

### Interpretation/Discussion

- A small sub-rectangular grave cut on an east-west alignment.

- **Finds (tick):** None [ ], Pot [ ], Bone [ ], Flint [ ], Stone [ ], Burnt stone [ ], Glass [ ], Metal [ ], CBM [ ], Wood [ ], Leather [ ]

### SUB-ADULT SKELETON RECORD

**Context No.:** 733

**SITE CODE:** A721

**SITE NAME:** Longhills

**Fill of:** 731

**Completeness:** 10 - 15%

**Orientation:**

- **Condition:** Poor - Very poor of skull, long bones + vertebrae
- **Age:** Neonate
- **Sex:** ?

**Plan No(s):** 341, 347

**Posture:** Supine?

**Section No(s):** 207, 208

**Coffin:** Not seen

**Coffin fittings:** nails / fools.

**Samples:** S86 - S89

**Soil description** (see Context 732)

**Additional description:** Small grave cut, backfilled with natural chalk + silt.

**Interpretation:**

The very poorly preserved remains of a child (Neonate), only a tiny proportion of bone survived, buried on E-W line, and close too but not intercutting grave (413). Group 765

Description (See check lists):
1. Sub-rectangular. @ near vertical sides with sharp break of slope to flat base.
2. 0.89m x 0.47m x 0.50m deep.
3. Long axis orientated E-W. @
4. This feature looks to truncate rectangular feature [751] [752].
5. (749) @ this feature was recognised during exc. of [751] and exc. separately upon identification. Located in an area of prolific disturbances & truncations.

Interpretation/Discussion

Grave cut - recovered disturbed pot & Some H. Bone.

Only one insitu coffin nail 1957 - less assoc. with another grave fill.

This cut was had no distinguishable skeletal/coffin or cremation deposit. Looked to be empty.

Finds (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ]

**DESCRIPTION (See check lists):**

1. Rectangular, E-W aligned.
2. Near vertical sides breaking to slightly concave flatish base.
3. 2.40 m x 0.77 m w x 0.76 m deep. 
4. Truncated by [346] + [658] [658] [653] [833] [752]
5. This feature was initially dug on 15/12/03 with [752] being extracted. Later it was obvious that [752] was only the upper fill, hence re-excavated and recovered sk 683.

This Cox is for a grave Group: [682] (684).  
HEAVILY TRUNCATED BY GRP 755.

ALL THAT SURVIVES IS THE EAST 1/2 OF NORTHERN EDGE OF THE CUT (682). -- THE FILL IS INDISTINGUISHABLE FROM (677) OR GRP 755. QUITE POSS THE FILL WAS EXTRACTED + REDEPOSITED AS PART OF (677). 2 REDEPOSITED SKULLS WERE RECOVERED IN THIS AREA AND ALLOTTED TO (677) THE LATER EVENT.

\[677\] = GRP 755

\[682\]  
GRP 760.

\[684\]

**Discussion**

IN SITU COFFIN WOOD SURVIVING IN SMALL PART - PLANNED AND GEO-REF PHOTOGRAPHED. HOWEVER TOO POOR CONDITION TO BE LIFTED - NO SAMPLE TAKEN.

THIS SURVIVING ELEMENT APPEARS TO BE COLLAPSED RATHER THAN SURVIVING IN ORIGINAL POSITION.

At a coffin or skeleton may have been truncated away, although by what is unclear. None-the-less, the clarity of this cut in plan does suggest it was a grave and so has been recorded as such.

It cuts earlier grave [739], and has been itself cut by grave [591].

This context is: Gr 770

**Interpretation/Discussion**

This group consists of a young male skeleton within a SW-NE oriented grave. A coffin was identified through the presence of 21 coffin nails. The grave has been truncated by two later features. The first, Gr 800, disturbed...
only the upper fills of the grave and did not disturb either the skeleton or the coffin fittings. The second (later) truncation just caught the left shoulder of the skeleton and also seems to have disturbed some of the coffin nails. One nail, 1526, has been allocated to Group 625 but might have fallen from Group 770 when truncated.

**Description (See check lists):**

1. Friddle - chalk backfill.
2. Light - grey chalky white.
3. 90% chalk 10% silt.
4. Flint (small amount).
5. 0.5m C.东部 2.5m natural.
6. 7. Grove backfill, mostly composed of chalk.
7. Some silt.
8. By hand, ground 5cm.

**STRATIGRAPHIC MATRIX**

```
[Diagram showing stratigraphic matrix]
```

**Interpretation/Discussion**

This deposit is mostly composed of backfilled chalk. It is fairly compact, and a modern concrete pipe run has partially truncated the grave cut. This deposit contains some silt, but is similar to the natural chalks in many respects.

SITE CODE: AY21
SITE NAME: Carphilly

Orientation: E-W
Condition: Poor - skull + long bones best preserved
Posture: Supine
Sex: ?

Complete: 50%

Associated SF number(s): 1910-1916, 2023-2028
Samples: 655-639

Soil description (see Context 774): Freable, chalk backfill with silt

Additional description: Adult skeleton under modern concrete interface, pressure of the concrete may have crushed skull. Skeleton under concrete, in good condition, grave truncated. Poor preservation, no vertebral ribs, small amount of pelvis surviving. No left arm?, but probably caused by degradation.

Hyoid bone: N0
Sesamoid bone: N0

1. materials 2. size of bricks etc 3. finish of stones 4. coursed / bond 5. form 6. faces 7. bond 8. dimensions as found 9. other comments

Description (see check lists):
5. Thickness = 0.40m 6. Extent = 1.35m
7. This grave was excavated at hand (mattock & spade) in wet overcast conditions.

Interpretation / Discussion
Backfill of grave 7147. observees chalky deposit (716) more or less indistinguishable from deposit (772) found above which has been truncated by grave cut (7117) to which this deposit belongs.
Some charcoal bones were found within this deposit — 2.
2. A few phalanges and some corroded bone.

**Description (See check lists):**

This CTX is for Grave Group:

- [751], Upper Fill (751), Lower Fill (833) + SK 683.

SF's - HOB NAILS - 2154 Lt. Foot, 2155 Rt. Foot

SAMPLES - 663 - 667 from SK 683 in Lower Fill (833).

This GRP was exc. Initially on 15/2/03 - and recorded as if (752) was only fill. Upon recording, realised (752) was only upper fill. So re-excavated and found SK 683. During exc. abundant amounts of Re-deposited: Animal, Human Bone, Pottery, Shell were recovered from both fills. Even several FE Coffin + HOB Nails were recovered from the two fills.

Upon completion of this GRP, there is another grave cut visible along the South half of this feature as yet un-numbered.

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

- Small Finds

- Building Materials

**Recorder:** RW
**Date:** 23/12/03
**Initials:**
Group 790 was excavated in two phases, and planned with different drawing points because of the hiatus.

Upon revealing the skeleton 683, it was apparent that there had been no coffin with this interment, but the skeletal did have hobnail boots associated with each foot.

- Sections were amended with best fit hand measurements since the pins had been removed.

#### STRATIGRAPHIC MATRIX

```
  \[\text{Cr} \, 675\]  
  \[\text{Cr} \, 800\]  
  \[\text{Cr} \, 770\]
```

#### Description (See check lists):

```
Backfill (769)
Grave (768)
```

#### Interpretation/Discussion

This group consists of a possible grave cut and its fill. It did not contain a skeleton but is highly truncated. It cut group 770 and has been cut by group 675, neither action causing any serious disturbance.

#### Finds (tick):

- Pot [✓]

630 - 634

Soil description (see Context 738)

Additional description:
V. well preserved pair of legs. No other bones survived. Some teeth were also recovered.

Interpretation:
A modern pipe trench cut above where the torso would have been. It is likely that contaminants from this were the cause of the poor preservation of the upper body.

Co-Ordinates: 230

Coffin: None

Coffin Fittings: None

**Additional description**

Although all the bones were present and complete they were extremely fragile and broke on contact due to high moisture content. This adult female appears to be placed into a pre-existing grave cut out of another coffin. She is or is oriented E-W, instead of W-E i.e., different from the norm on this site. There nothing remains of any possible coffin and the skull had collapsed.

**Stratigraphic Matrix:**

- This context is

**P.T.O.**

**Recorder:** RB

**Date:** 18.12.03

**Initials:** R5
Grave of adult of indeterminate gender. Heavily truncated by grave group 710. Only eastern end and northern edge of cut [783] remain - skeleton truncated except legs + feet although possible coffin nails (1976, 1976 + 237) belonging to coffin (786) survive beneath the skeleton (1782) in group 710 (ref. 710) as does a bone comb (1785) which probably belongs to this grave (ref 710).

Sides of grave slope at shallower angle (c. 75-80° rather than vertical) than surrounding graves & location of coffin nails would suggest the width of the grave at the base of the cut (c.0.35m) was only just sufficient to accommodate the coffin (this would suggest that the bone comb was within coffin (786) although this is by no means certain).

A small quantity of hobnails (1972) and a boot plate (237) were recovered from beneath the feet (pl.357).

For sketch see Group 710

- **Samples:** 674 - 680

**Co-Ordinates:**
- Coffin fittings: 2086-9, 2091, 2094-9, 2106-8
- Nails: 2110-1, 2115-8, 2158-63, 2193, 2196-8

**Soil description:** (see Context: 813)

**Additional description:**

No DNA sample taken due to poor preservation of metacarpals.

Hand seemed to be resting together on abdomen.

Adult male lying in a W-E orientated coffin and grave.

A group of hobnails was found around the right foot.

The associated grave cut truncates earlier grave (824).

So some SF nails may be earlier than this grave.

1. Sub - Rectangular
2. Flat base - Vertical sides
3. Dimensions unknown - Surviving depth -
4. See Plan 370
5. Truncated by modern footings associated with school.
6. Filled by (823)
7. Part of Grave Group (865)

**Interpretation/Discussion**

Grave Cut [822]

This grave is too heavily truncated to retain any skeletal material from the in-situ inhumation. However two fragments of long bone large recovered. One of these appears to be a fragment of ulna, and thus due to the position of surviving grave being the eastern extent, where the feet of an east-west inhumation would be expected, this material is being treated as lateral. Also this material displayed no structure - fell out of section during excavation.

4. SMALL (0.01 - 0.05m dia) Chalk Frass + Flint Nodules
5. OCCASIONAL LARGE FLINT NODULES (0.15 - 0.25m dia)
6. 0.67m thick. a. 210m x 0.77m w.

**Interpretation/Discussion**

This is the lower fill of (757) defined by larger + more compact Chalk Frass at interface with (752).

The Sk. 683 is **directly above THIS**. Fill of (757) part of Group 790.

**DESCRIPTION (See check lists):**

1. Friable.
3. Clayey silt + chalk.
4. 50% poorly sorted angular chalk fragments.
5. Filled full extent of grave cut.
6. Trowelled excavation — dry + wet periods, poor light.

**INTERPRETATION/DISCUSSION:**

Grave backfill deposit consisting of former topsoil and excavated chalk bedrock fragments. Pottery fragments situated by right pelvis. 14 coffin nails were recovered.

2 sets of hobonails were situated at the east-end 2191 + 2203. Plan 409.

1 Finger-ring was situated at the south side: 2266

### STRATIGRAPHIC MATRIX

- [Diagram showing stratigraphic relationships]

### Description (See check lists):

**Grave fill consisting of**
- 666 Grave backfill
- 667 N-E skeleton
- 1664 N-E Grave Cut

### Interpretation/Discussion

The skeleton was poorly preserved but the skull survived enough to determine female 20-25 yrs. No grave goods were present. The skeleton was placed within a coffin; nails were present even though the coffin lid was not.

### Finds (tick):
- None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

### STRATIGRAPHIC MATRIX

| 863 | 867 | this context is 842 |

### Description (See check lists):

1. Circular, shallow depression. Potentially cut into an exiting grave on an E-W alignment. 2. Sloping sides, cuts through other cremation layer [868]. 3. Latest 50 x 34 cm diameter, depth 0.22 m. Truncated on top by modern building debris. (842). 7. A cremation pit, with remains of a glass vessel - possibly the funerary urn? This is the cut of a cremation. The grave good included, glass pieces (pot with?), and remains of a bone bowl breccia.

### Interpretation/Discussion

This is the cut of a cremation. The grave good included glass pieces (pot with?), and remains of a bone bowl breccia.

---

The document details an archaeological context record for site A7121, focusing on a cut or depression, its dimensions, and associated artifacts. The stratigraphic matrix indicates the relationship of this context with others, labeled as 842. The description and interpretation discuss the nature of the excavation, including a potentially cut grave and a cremation pit with notable grave goods.

Description (See check lists):

GROUP 850 CONTAINING GRAVE CUT (808), BORROW-HILL (604).

SKELETON (806). THIS GRAVE HAS BEEN CUT INTO THE TOP OF AND TRANSMITTED ACROSS SOME OF. GRAVE GROUP 1090 ([877, 878, 879] IS A DEPTH OF AT LEAST 0.50M FROM THE SURFACE OF EXCAVATION. THE DIMENSIONS OF THIS GRAVE ARE A = 20CM.B = 80CM. THE BORROW-HILL IS A LOOSELY COMPACT WHITE-GREY CLAY DEPOSIT. THE SKELETON RETRIEVED FROM THIS GRAVE CARRIES AN E-6 CRIBBED BURIAL BURIED IN A SUPINE POSITION.

**STRATIGRAPHIC MATRIX**

```
[Diagram of stratigraphic matrix with context 855 highlighted]
```

**Description (See check lists):**

- Back fill (813)
- Skeleton (812) coffin staining (811)
- Cut (809)

**Interpretation/Discussion:**

This group consists of an adult male skeleton within a W-E orientated grave. A coffin has been identified through the presence of 27 coffin nails. A group of hobnails were also found by the right foot. This grave group has truncated two earlier.

**Finds (tick):** None [ ], Pot [ ], Bone [ ], Flint [ ], Stone [ ], Burnt stone [ ], Glass [ ], Metal [ ], CBM [ ], Wood [ ], Leather [ ]

**Small Finds:** 1990, 2088-9, 2091, 2094-7, 2106-8, 2110-1, 2115-8, 2153, 2158-63, 2173, 2176-8

**Recorder:** LN

**Date:** 5/11/04

**Initials:** [Signature]

**Recorder's Sign:** [Signature]
grave groups, 880 and 900. The truncation of group 900 probably explains the presence of a shale bracelet and some infant channel within the upper backfill.  

Some of the coffin nails allocated to this group may also have originally belonged to group 880 but were disturbed by the truncation of the grave. This would explain why nails 2106-8, 2111, 2115-6, 2173 and 2178 seem to be in odd positions in plan.

Articulated foot was recognised in px, and is presumably the "infant channel" referred to above.

---

**DESCRIPTION:**

No. for v. large grave containing skeleton

Buried in a coffin. Only the legs and feet

of the skeleton survived. The coffin

contained 12 v. large nails. Skeleton was buried with a coin near

the skull. 2 clusters of animal bone suggest that animals/food were also

placed in the grave.

The grave was cut by a later pipe trench - probably the cause of the

poor survival of upper body. (contaminants leaking down onto the skeleton)

It was also cut at the east end by building footing. A small

pit [734], (736) was also cut into the backfill of this grave.

Cut [737], backfill (738), coffin (793), skeleton (802)

1. materials 2. size of bricks etc 3. finish of stones 4. coursing/bond 5. form 6. faces 7. bond 8. dimensions as found 9. other comments

**Description (See check lists):**

1. Fresh
2. Dark grey/black + chalk back fill
3. 70% charcoal, burnt bone, 30% chalk
4. Thickness 0.23m
5. Extent 0.34m x 0.37m
6. Cremation fill of small truncated cremation pit
7. By travel/should/wind/grey and cost

**Interpretation/Discussion:**

This fill is a cremation fill consisting of burnt bone + charcoal. No grave goods were found. The cremation pit has potentially been truncated by modern building activity relating to its shallow depth.

Description (See check lists):
1. Rectangular 2. Vertical sides, flat base
3. Dimension: depth: L = 2.45m W = 0.90m
5. Truncated by grave (803), which
has been cut into the top southern side of this grave.
6. This grave is backfilled soil (878) which covers coffin (883) and
skeleton (879).

INTERPRETATION/DISCUSSION
DEEP W-E ORIENTED GRAVE CONTAINING ADULT SKELETON
HAS BEEN CUT INTO BY LATER GRAVE (803).

This context 880

**DIGITAL:** 255/PC230016 + 256/PC230017

**Interpretation/Discussion:**

This group consists of an adult male skeleton within a W-E oriented grave. A coffin has been identified through the presence of eighteen coffin nails. There were also two hobnail shoes, one on each foot. A pot was placed between the skeleton's feet.

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

**Small Finds:** 2090, 2093, 2105, 2109, 2112-4, 2156-7, 2164-42, 2174-5

**Samples:** 668-673

**Building Materials**

**Recorder:** LN

**Date:** 5/1/04

**Initials:**
This group has been truncated by group 855 and has itself truncated group 900. The presence of an infant channel within the backfill of this grave is thought to be originally from group 900. The truncation this group from group 855 has damaged skeleton 826 quite badly. His right arm, femur and torso are all missing, and many coffin nails seem to have been disturbed.

In plan it is not easy to see the relationship between this group and 855. The main reason for it being decided that this group is later is the assumption that the infant channel was part of 900 and was disturbed by 880 when it truncated it.

8. By hand / forecast

Interpretation/Discussion
Mixed deposit containing cremated bone and pot fragments. This deposit is distinct from the others in the group in that unlike (889) it contains cremated bone, etc and unlike (888) it contains almost no charcoal. This deposit probably relates to biodetrivational event (892) but is not actually contained within it.

Description (See check lists):
1. Oviedo 2. Base concave, sides steep + irregular 3. Length 0.8m approx, width 0.15m approx, depth 0.15m approx
6. Filled by 893

Interpretation/Discussion
Biotaification - probably caused by rodents. (cuts diverge)
Distinctly from cut of cremation pit. Fill contained charcoal and crem. bone

Finds (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ]
CBM [ ] Wood [ ] Leather [ ]

### Site AY21

**Additional Sheets:**
- Context Type: Deposit / Cut / Structure
- Overlain by: [Mark]
- Abutted by: [Mark]
- Cut by: [Mark]
- Filled by: [Mark]
- Section No.: Same as: 400
  - Part of: [Mark] 415
- Co-Ordinates: Consists of:
  - Overlies: 871, 842, 862
- Level: Butts:
- Slide No.: Cuts: 401
- Neg No.: Fill of: 401

**Matrix Location:** Relationships uncertain

**Description (See check lists):**

1. Friable
2. Mid brown with chalk inclusions
3. Clayey silt
4. 15% chalk, 5% modern building debris
5. 15m - 0.2m
6. 1.62m by 1.38m

7. A mid brown deposit that appeared to be cutaneous.

**Interpretation/Discussion:**

A brown deposit that overlies the cremation 871/842.

[Mark] 862, 842, 862, and also the ground/base that underlies them. This fill is potentially a result of the cremation being backfilled and sealed, contained with modern building debris on top.

A layer of modern debris - overlaid by [Mark] 401, cleaned by hand.

**Interpretation/Discussion**

This grave group has been so heavily truncated by groups 880 and 855 that only a corner of the grave cut 1844 remains. Within this one a coffin nail was found, 2092.

When the two later grave groups were

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ]

CBM [ ] Wood [ ] Leather [ ]

- Small Finds 2092
- Samples

**Recorder**: LN

**Date**: 5/1/04

**Initials**: KB
being excavated, both graves contained the channel of a child in their backfill. There was also a small shale bracelet within the backfill of grave 1809. It seems likely therefore that this highly truncated grave was that of the truncated child skeleton.

The channel suggests the child to be about 4 years old.

In plan it is not easy to see the relationship between this group and 4R880. The main reason for it being decided that this group is earlier is the assumption that the infant channel within the backfill of 4R880 came from this grave and was disturbed when 4R880 was excavated 4R909.

(265) An articulated adult foot was found presumably in situ, in the surviving corner of the grave.

- 261/P1060025 + 262/P1060026 = General Shots

### Geo-reference pts.
- N462 - 467

### Interpretation/Discussion
- W-E aligned burial of adult male aged 50+ (subject to osteological confirmation). No coffin fittings were recovered and no evidence of shrouding that would suggest an entirely wooden coffin was observed. The skeleton (861) was lying prone with the hands crossed beneath the pelvis, the feet pointing north and the skull facing south (see sketch over).

Hobnails were recovered from "beneath" (ie. to the east) of both feet with a concentration of boot plates around the heel of the left foot, perhaps indicative of frequent repair ???

Alternatively, as the ball of the right femur showed considerable bony growth and was presumably v. painful, the increased wear on the left "boot" may have necessitated additional plates ???

The condition of the skeleton was v. good and no doubt osteological analysis will provide more detailed information, particularly regarding the right arm, the ulna + humerus of which were fused together possibly as a result of a break to the upper ulna which had subsequently been supported in a flexed position whilst healing, resulting in a right arm permanently bent at the elbow.
The mandible also suggested considerable age as only 9 teeth were recovered and the majority of the "tooth holes" had "healed" over.

A small 'disc' of copper alloy c. 0.01m diameter was also recovered from the backfill overlying the right arm although its function is unclear - possibly the head of a shroud pin?? although no other evidence of a shroud was observed.

It is possible that the hands were tied together although particularly given the injury to the right arm it seems far more likely that the body has been deliberately laid out.

Some distinction is being made by the fact the body is prone, the shallowness of the grave, the lack of grave goods + a coffin although quite what is under.

FUSED ULNA + HUMERUS OF RIGHT ARM OF SKELETON 861
| Probably contemporary with groups 680 + 955 | as on similar alignment and appear to respect each other as opposed to 2 earlier groups (925 + 965) which are on a slightly different alignment (ref. Plan 449) + are truncated by these 3 groups. |

2. Flat - base    steep/vertical sides
3. 2.40m length x 0.75m width x 1.10m depth.
4. -

Interpretation/Discussion

Regular shaped grave cut.

Truncates the deposits associated with the hedge-row feature - Group 460. The grave cut is also located very close to grave-cut 962 (SEP 103). The deposits remaining between the two features appear to have been part of the hedge-row deposits and measured approx - 0.10m width.

**Interpretation/Discussion**

This group consists of an infant skeleton (aged between four and five) in a W-E aligned coffin and grave. A coffin has been identified through the presence of 19 coffin nails (2264-5, 2279-83, 2379-86). Two hobnail shoes were found beneath the coffin.

legs (2387 and 2388). Also found was a stack of bracelets and beads (finds ref 899) which was positioned at the bottom of the coffin, roughly in the position of the right foot. A full description can be found on finds ref context sheet (899).

The skeleton was in a very poor state of preservation, only a fragment of the cranium and fragments of different leg bones survive.

**STRATIGRAPHIC MATRIX**

| 922 | 921 |

**Description (See check lists):**

1. Sub rectangular (kinks at both ends - see sketch)
2. Flat base and straight vertical sides.
3. 2m x 0.7m, 0.6m deep.
4. See below
5. 922-3

**Interpretation/Discussion**

Grave cut for a W-E orientated coffin. Shown on plan 424 as butting up against grave 873, but there is no relationship between the two.

Sketch plan

### BUILDING MATERIALS

- [List]

### RECORDED

- Recorder: RG854
- Date: 16.1.04
- Initials: [Signature]
Time of interment. The hobnails by the left foot (2579) were also accompanied by what appeared to be a large boot plate (2533) which may account for the relatively small number of hobnails (although no boot plate was recovered from the group of hobnails around the right foot (2580)).

Both tibia appeared to be slightly bowed, perhaps suggesting disease (?ricketts), although the fibulae were underneath the tibia, which may account for the appearance of bowing?? (ref. osteological analysis).

Possibly it is possible that this grave is roughly contemporary with group 965 as they appear to respect one another and are on the same alignment, as opposed to the later graves.
groups 680, 955 + 905 which truncate them & which also respect each other are on the same alignment as each other (Ref Plan 449)

ie groups 965 + 925 are part of an early phase of burial & are no longer visible on the surface by the time graves 680, 955 + 905 are dug. This may suggest a significant period of time had elapsed between the digging of 965 + 925 and that of the later 3 graves.

Nevertheless, where 955 + 925 do truncate the upper fills of the earlier graves, they stop short of truncating the burials, perhaps suggesting that the excavators of the later graves stopped when they began to encounter definitive
evidence of the earlier burials (i.e. coffin, nails / wood) ????

**Interpretation/Discussion**

Cut 933 exists entirely within the backfill of grave cut 941. For this reason it has no chalk edges of its own of which a plan has been drawn. Depth of this grave can only be estimated from the levels taken on skeleton 938. In plan both grave 933 and grave 941 were indistinguishable from each other in plan prior to excavation, and thus the two graves were dug in plan together. It was always expected that there were two graves here, however this was due to the large and irregular shape of the visible cut in plan. However, it only became proven that...

**Recorder:** [Signature]

**Date:** 16/01/04

**Initials:** [Signature]
Two graves were cut at this point when a second skeleton was discovered while cleaning up the first skeleton. As no obvious evidence for the second inhumation was apparent from the cut into the chalk for the initial burial, it appears that a large and irregular grave cut was excavated to incorporate the earlier grave burial 939. This grave was then backfilled. At a later time a second grave was cut, this time entirely through backfill 942 which covered burial 939. The actual depth of this later grave cut and the precise dimensions are unknown to me because of the identical nature of the backfills of both graves. All that can be said is that grave cut 983 was not deep enough to cause any noticeable damage to the earlier grave burial.

Cut [983] totally within backfill of cut [941].

**Interpretation/Discussion**

The actual interface between this deposit and deposit 912 which is the backfill of grave 941 through which grave 933 was cut, is impossible to ascertain. Both deposits looked identical in plan and were dug together in plan due to this its extent is impossible to know.

### Soil Description
- Chalk and Sarsen Mix

### Additional Description
- Part of Grave Group 990

### Interpretation
- Male 50+ individual buried E-W in a supine position within a coffin. Hands together on top of groin. Skull badly crushed, left femur preserved. Cut into which this individual was interred exists entirely within the backfill of grave 941.

### Stratigraphic Relationships
- Context 934

IT SHOULD BRIEFLY BE MENTIONED THAT DUE TO THE CLOSE PROXIMITY OF SKELETON 938 TO THE BELOW LYING AND EARLIER BURIAL SKELETON 939, THAT IT IS POSSIBLE THAT SOME 938'S SKELETAL MATERIAL MAY HAVE COLLAPSED DOWN AND BECOME INCORPORATED WITHIN THAT OF 939. I MENTION THIS BECAUSE DURING THE CLEANING OF 938, THERE APPEARED TO BE A METACARPAL WHICH LOOKED OUT OF PLACE, AND MAY IN ACTUAL FACT BELONG TO 939. HOWEVER DUE TO THE CHANCES OF DISTURBANCE BY THE LATER CUT, I WILL LEAVE IT IN WITH THE MATERIAL FROM 939 — NONETHLESS I WILL BAG IT INDIVIDUALLY JUST TO BE ON THE SAFE SIDE.

**Soil description (see Context 942):** CHALK AND SUBSOIL BACKFILL

**Additional description:** PART OF GRAVE GROUP 995

**Interpretation:** MALE INDIVIDUAL, APPROXIMATELY 55 OR OVER, BURIED WITHIN A COFFIN IN A PRONE POSITION. AGE RANGE ASCERTAINED THROUGH CRANIAL SUTURE CLOSURE, HOWEVER NO MANDIBLE AND LITTLE MAXILLA SURVIVED. NEVERTHELESS, AS NO TEETH WERE RECOVERED.

**Stratigraphic relationships:**

```
  942
  ----
  939
```

**Photographs:**

- Film 45 12-14
- DIGI A190007

</tbody>
</table>
From the grave, it would appear that this individual had lost all his teeth and had gum resorption. This would suggest that the age assigned by the cranial sutur closures would be correct.

With this body around the pelvic area were a few hand bones which look like they may in fact belong to the above lying and intrusive burial group 990. These bones have been bagged with the material from (939). However, within an individual bag. In situ, the hands of 938 would have directly lain above the pelvis of 939.

Skeleton 938 was lying directly above 939. The positioning of the hands would have been above the pelvic area of 939 -> thus hand bones bagged separately. Intrusive cut [933]

```

**Digi Photos:** 286/P1080001 + 287/P1080002

**Geo Ref Pts:** 502 - 507

**Interpretation/Discussion:**

W-E aligned inhumation of young adult of indeterminate gender. V. poor preservation with the exception of the legs and feet which are in good condition. Truncates upper fills of Groups 925 and 965.

No evidence for a coffin or shroud was recovered.

**Finds (tick):** None [ ], Pot [ ], Bone [ ], Flint [ ], Stone [ ], Burnt stone [ ], Glass [ ], Metal [ ], CBM [ ], Wood [ ], Leather [ ]

- Small Finds: 2386 - 2362
- Samples: 28 - 101
- Building Materials

**Recorder:** RB

**Date:** 9.1.04

**Initials:** RPG
Small finds: - NB: 2336 - 2339. Subsequently tested by metal detector and found not to contain any metal so NOT ironstone.

2356 - 2359: A row of 4 wedge shaped objects. Originally thought to be wooden pegs but apparently of the same material as 2360 + 2361 (see below). May just be fragments of ironstone but uniformity of shape + linear distribution seem to suggest deliberate deposition?

2360 + 2361: Two "hemi-spherical" fragments of ironstone with spoke-like lines on the flat underside - possibly just fragments of ironstone but proximity to each other, location at same depth as skeleton and proximity of 2356 - 2359 may suggest deliberate deposition?

2362: Three brownish-red, crystalline objects of indeterminate composition located around pelvis. Very tentatively interpreted as Gall stones??
The grave appears to be considerably longer than the skeleton, the eastern edge extending some 4.500cm beyond the feet. This may be a result of the grave cutting other features at its eastern end (i.e. it would presumably have been fairly easy to overcut during its original excavation given the soft nature of the material it is cutting at its eastern end.)

Probably "contemporary" with groups 680 & 905 as on similar alignment as opposed to 2 earlier groups (965 & 925) which are on a slightly different alignment & are truncated by these 3 groups (Ref. plan 449)

**Description (See check lists):**

1. Sub-rectangular
2. Flat base - steep/vertical sides
3. 2.40m length x 0.95m width x 1.20m depth
4. Truncates Group 640 - the deposits associated with the hedge row feature.

---

**Stratigraphic Matrix:**

```
  401
  963
 this context is 962
```

---

**Interpretation/Discussion:**

Favourably shaped grave cut excarnation into former hedge row deposits (Group 640). Steep sides that may have been prone to collapse during original excavation - slight concave profile along southern side.

The grave was excavated/placed very close to Group 875 with no little as 0.10m deposits between them. It's possible that one cuts the other although not possible to detect.

**Context No.** 964

**Site A421**

**Additional Sheets:**

**Type Fill**

**Description (See check lists):**

1. Friable
2. Mottled colouring of very dark brown, mid orange brown, dark orange brown, whitish brown
3. Clayey silts
4. 50% poorly sorted chalk fragments and gravel clasts

**Interpretation/Discussion**

Mixed backfill deposit of soils previously associated with the hedgerow feature (Group 640) and probably includes former top-soils. The fill also supports up to 50% poorly sorted angular fragments of chalk bedrock. Pottery sherds and assorted residual bone fragments were recovered.

Description (See check lists):
Cut - 928
8/fill - 929
Coffin - 981
Skeleton - 982
Bowl - 936
Pot - 937

Interpretation/Discussion
WE aligned inhumation of adult female
(subject to osteological analysis) accompanied by
coffin marked by 15 in-situ nails (2495-2509) and
fragments of "decorated" wood (ref samples); two
ceramic vessels (bowl 926 and pot 987) placed by the
feet within the coffin; and hobnails (2511) outside
the coffin adjacent to the northern edge of the cut (ref)

Finds (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ]
CMB [ ] Wood [ ] Leather [ ]

□ Small Finds 2495 - 2509 (in-situ nails) 2510 (WS nail) 2511 (hobnails)

□ Samples 744 - 751

Reactor
Recorder RB
Date 14.1.04
Initials RB
Group 680 truncates the southern edge but does not truncate skeleton or coffin as it doesn’t extend far enough north.

Group 955 truncates the upper fills of the northern half of group 965 but is not deep enough to truncate group 965. The skeleton or coffin.

A small fragment of potentially Iron Age or 1st/2nd century coarse ware with flint temper was recovered from the backfill (955).

Probably "contemporary" with grp. 925 as on similar alignment + both truncated by later graves (680, 955 + 905); they also appear to respect each other (ref. plan 449).

Relationship with group 1075 uncertain.

#### STRATIGRAPHIC MATRIX

![Stratigraphic Matrix Diagram](chart.png)

- **Digital Photos**: 316/P1190013, 321/P1190018

### Interpretation/Discussion

WE E aligned inhumation of infant (age 1-3 yrs?) of indeterminate gender accompanied by coffin evidenced by 15 in situ nails (3 in the SE corner, four in each other corner) - an anomalous nail head (2/173) was also recovered from within the projected extent of the coffin.

### Finds (tick):

### Recorder

**PR**

**Date**: 20-1-04

**Initials**: KB
Appears to truncate the SW corner of an as yet unexcavated grave, truncates hedgerow (grp. 460) and may have been truncated by a previously excavated grave.

Presumably something within the backfill at the western end of the cut has preserved the bone whilst elsewhere it has deteriorated completely. Given the location of the upper westernmost fixing nails (2662 + 2663 and 2653 + 2654) it is possible that the coffin has collapsed in such a way to facilitate this preservation.

Relationship with group 1075 uncertain

#### Interpretation/Discussion

**HEAVILY TRUNCATED GRAVE CONTAINING CREMATION DEPOSIT.**

This cut also had 7 coffin nails, which due to their position would suggest an in-situ coffin — if dumped with deposit it would be unlikely that the nails would have been spaced as they are —

Also — if there was an in-situ coffin, no body was excavated. Waiting investigation of sample.

**Description (See check lists):**

1. (a) Context Consolidated
2. (b) Dark brown with black/grey burning
3. (c) Confined predominantly of cremation deposit
4. (d) Burnt flint, bone, pot, coffin nails
5. (e) 0.55 x 1.45m
6. (f) This material has been 100% sampled

---

**Interpretation/Discussion**

Cremation material forming the backfill of grave [982], which is extensively truncated. Seven coffin nails were recovered from this deposit — the even spacing of these nails tends to suggest an in-situ coffin, however how this relates to the cremation deposit is unknown.

#### Description (See check lists):

Bear # for grave consisting of:

- **927** Backfill
- **926** N-E skeleton
- **924** Grave cut

The skeleton was within a coffin - only survive but no coffin stain remained.

#### Interpretation/Discussion

The skeleton was a juvenile c. 14-15 yrs razor with its head facing north. A cluster of beads was in the immediate N. of the skull (ADD SHEET 2) beneath which was a circular cluster of beads (ADD SHEET 2). Beneath the skull was a single cutlay pin 2578. This group indicates the western edge of earlier grave group 1045.

**INTERPRETATION/DISCUSSION**

GRAVE GROUP (CONSISTING OF GRAVE CUT [933], SKELETON [938]

AND BACKFILL [934]). ASSOCIATED SMALL FINDS ARE 2447, 2456, 2467, 2468,

2514, 2515 - ALSO HUMAN UNSTRUCTURED AROUND THE CRANIA (2449).

THIS GROUP HAS BEEN DIG COMPLETELY THROUGH THE BACKFILL OF EARLIER GRAVE [941]

DUE TO THIS REASON NO OFFICIAL POST-EX SIGHTS EXIST OF THIS GROUP. THE CUT AND EXTENT

OF THE BACKFILL HAVE BEEN STARLIGATED THROUGH POSITION OF BODY + COFFIN NAILS ET.

**Description (See check lists):**

Finds reference for broken pot found on the surface of grave group 1180-grave 1982. Pot was inverted and given a FR. # in case it was complete—however only fragments survived. With hindsight, it should have been classed as a bulk find within backfill 983.

- Part of: [943] [944] (1001) (1002)

**Co-Ordinates:** E:15056.2878, N:15063.3654, M:517389.306

**Description:**
- **This Group Number Pertaining to Grave Cut**
  - [943] Rockfill (944) Coffin (1001) and Skeleton (1002)
  - *Matrix:* [944] [943] [944] (1001) (1002)

**Stratigraphic Matrix:**
- Context: 1000
- **Digital Photos:** PI140015
  - 319: PI140016
  - 520: PI140017

**Interpretation/Discussion:**
- **The dimensions of the Grave are:** L=7.25m, B=0.90m, D=1.08m. The Eastern end is overlain by a slightly cut by a shallow layer of modern concrete, slightly obscuring the grave. The Coffin is represented by Coffin Nails following a 'Coffin-Shape' Pattern. The Rockfill is a Loose Charcoal Deposit characteristic of this Cemetery Site, within which a Coin (3.4cm) was recovered. The Skeleton (1002) is Buried created 0-2cm and primary estimates indicate it to be a Male aged 45-50 years. Next to the left foot a Large Spindle-whorl was recovered.

SITE CODE: A121
SITE NAME: LANKHILLS

Fill of: 879
Completeness: 85% (missing hands, vertebrae, ribs, skull damaged)

Orientation: E - W - E
Condition: GOOD
Posture: SPOINE
Coffin: YES - represented by nails
Coffin fittings: 460 - Fe nails

Section No(s): GEO-RECT.
Co-Ordinates: E: 153096, N: 5173183

Age: ADULT
Sex: MALE
Samples: 786 - 793

Soil description (see Context 879): Light grey - brown chalky deposit - chalk backfill

Additional description: Preservation of this skeleton varies from v. good in long bones & feet, through to poor in the torso & pelvic areas.

Interpretation: This individual was buried supine and oriented E-W. Preliminary estimates suggest this to be an adult male aged 45-50 years.

**STRATIGRAPHIC MATRIX**

- **Gr1020**
  - This context: 41005

**Description (See check lists):**

- 954 grave backfill
- SK952
- 953 coffin staining
- 951 grave cut

**Interpretation/Discussion**

This group consists of a W-E orientated grave cut containing a coffin and a skeleton. The skeleton was in an appalling condition with only a few cranium fragments remaining. Six coffin nails located one end of the coffin, the other end has been.

This CTX is for Cremation Vessel.
- 310 mm Tall x Ø270 mm Dia.
- Black Burnished
- With what looks like fine sand temper
- Quite Flabellate
- Large out-turned rim with a thinner neck opening
- Distinct shoulders with a conical slope to flat base

Cremation Vessel - Lifted intact with (cremation fill (1008) still inside.)

**Building Materials**

**Recorder:** RE

**Date:** 28/1/14

**Initials:** [Signature]
A small remnant of a grave cut was visible after cleaning. However, no evidence for another cut was sound within [1011], so grave must have been shallower and shorter than [1011]. Presence of one coffin nail near top of fill of [1012] suggests that when the grave was cut the coffin in grave [1099] was significantly degraded. However, scant evidence of channel in deposit suggests that the skeleton in [1099] was almost completely removed and interred elsewhere.

<td></td>
</tr>
</tbody>
</table>

#### Interpretation/Discussion

Back fill as grave, probably Roman. Dating evidence: Roman pot (a stirrup). Deposit contained fragments of human bone as well as (presumably native) animal remains. Human bone probably derived from graves [1012] and [1092].

STRATIGRAPHIC MATRIX

1014
1011

Interpretation/Discussion

Backfill of grave. Heavily truncated by 1017. Not enough of grave survived to recover any skeletal remains, but the small quantity of charred bone in 1013 suggest that the skeleton was removed before the coffin decayed and the bones interred elsewhere.

**Initials:** D.
This group contained a 50+ male in a W-E oriented coffin and grave. A coffin has been noted by the presence of at least seventeen coffin nails. A further five were found within the grave backfill, but were probably from the coffin in grave \([55]\) which.

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

**Small Find:** Nails 2589-93, 2618-21, 2635-40, 2682-5

**Samples:** 821-828

**Building Materials**
was truncated by group 1020. (Nair 2589-93)

The skeleton has curvature of the spine which is possibly antylosis. This has also caused the right pelvis to turn in towards the body and dioto with the right leg.

The fill of the grave contained a noticeable amount of charcoal and some pottery sherds which were most probably from an earlier cremation truncated by this group.

A coin 2688 was found inside the skeleton's mouth.

6. 1052-3

Interpretation/Discussion

We oriented grave cut truncated by

grave [1051]. Contains an adult in a

very bad state of preservation in a coffin.

At its NW corner it is either cut by or

cuts grave [401], but it such a slight truncation,

it is hard to tell which grave is the.

**Description (See check lists):**

1. Loose
2. Pale yellowish brown
3. Clayey silt
4. Frequent small medium chalk blocks; moderate
5. Sub-angular flint; occasional med-large flint nodules
6. 0.5m
7. 0.64 x 1.9m
8. Cut away by later grave (1067) and by modern school trench.
9. Matted and trowelled in icy conditions.

**Interpretation/Discussion**

Grave backfill.

Please note: SW corner of this grave was originally thought to separate grave and therefore given context no. (1068).

**Description (See check lists):**

1028 - GRAVE CUT
1029 - GRAVE BACKFILL
1031 - COFFIN
1082 - SKELETON

**STRAJGIRAPHIC MATRIX**

**DIGITAL PHOTOS:**

- 336/P120010 (Gen. shot of crossbow brooch)
- 337/P120011 (whole skeleton)
- 338/P120012 (Skeleton)
- 589/P120013 (Upper) 346/P2004 (ABRAID SHOT OF BROOCH)

**Interpretation/Discussion:**

WE aligned inhumation of adult of indeterminable age and sex. Very poor bone preservation. Accompanied by coffin evidenced by 12 fixing nails all located at the corners with 4 approx. 0.3m from the base (27, 27.2, 27.35 + 27.60) presumably representing fixing nails for the lid lie higher up and slightly slightly "disturbed" having moved during...

**Finds** (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CMB [ ] Wood [ ] Leather [ ]

**Small Finds**

- 2731 - 2762 (COIN NAILS)
- 2763 (STAFF END)
- 2764 (CROSSBOW BROOCH)

**Samples**

- 837 (SKULL)
- 838 (TOREO)
- 839 (FEET)

**Building Materials**

**Recorder:** FB

**Date:** 22/1/04

**Initials:** FB
decomposition of coffin). The other 8 are made up of groups of 2 nails at each corner fixing the coffin base (one upright & one horizontal).

Also accompanied by a Cu Alloy crossbow brooch (2744) located to the north of an area of fragmented bone & tooth enamel representing the remnants of the skull; and a Cu Alloy strap end to the south of the left femur (only one strap-end recovered - spoil re-sifted but companion strap-end not found).

Coffin wood had been preserved beneath both Cu Alloy finds, perhaps as a result of some reaction with the corroding metal?? - The preserved wood was included with the soil sample (837) taken from the skull area and may contain fibres of any garment to which the brooch
was attached (although the fact that it is located by the head may indicate that it was placed in the coffin rather than being worn by the corpse). The poor bone preservation meant that only the long bones of the legs survived (and they only partially) with the exception of the fragmented skull, tooth enamel and some miscellaneous bone (including some foot bones).

The relationship with the 2 groups (980 + 965) to the NW (965) + SW (980) is uncertain as they only intercut at the corners (ref. sketch). The comparative dates of the brooch (2744) + strap-end (2743) and the pottery recovered from group 965 (936 + 937) should give a better indication of the relationship.
The depth of the grave (1.6m bgl) may also be significant when compared to the other graves of similar depth to the northish, although this will need further investigation of dates/distribution of artefacts etc. etc. etc.

Both the 'horizontal' and 'vertical' crosspieces of the brooch showed some evidence of a fabric adhering to them OR this may represent a stippled decoration - this was not investigated closely for fear of damaging any evidence which may remain (see sketch below).

Additionally, the underside of the U-shaped section of the brooch was a very bright blue (ref. lapis lazuli) whether as a result of corrosion or decoration is unclear.

**DESCRIPTION (See check lists):**

**This group consists of grave cut (1231) and backfill (1232). This cut was placed in the boundary ditch to the north of the site. A coffin nail was found but no further evidence for a coffin was found. The skeleton was an adult male (45-50 years of age at death) lying prone and oriented N-E. A copper alloy coin was placed in the mouth of this individual. Horns and jet plates were found surrounding the feet indicating bones were part of the clothing upon burial.**

display any such evidence. Large gap between the end of the feet and the southernmost coffin nail suggest that the coffin was not intended for a decapitated.

**Interpretation:** There is clear evidence that this individual was given an "honourable" burial (i.e., buried in a coffin) which is at odds with the way she died. Could it be the case that she was executed by the municipal/imperial authorities and buried by her family/friends with a notable amount of disrespect (i.e., her head face down)? Whatever the case may be it is clear that this person clearly was not revered and positioned as the head would have been placed in the correct anatomical position.

5. (1087) - Mid orange brown, clayey silt

**Interpretation/Discussion:**

This linear feature is aligned approximately north-south and possesses dimension characteristics familiar with adjacent grave-cuts. However, the depth was only 0.30m and with a concave base with no sign of a burial. Possibly the feature is an abandoned grave excavation.

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

**Context Record**

**Site:** AY21  
**Context No.:** 1087  
**Type:** Fill

**Description:**
1. Frickle.
2. Mid orange brown
3. Clayey silt
4. 20% poorly sorted sub-angular gravel clasts.
5. Approximately 0.25m thickness
6. Fills full extent of feature
7. Trench excavation

**Interpretation/Discussion:**
Backfill of a possible abandoned grave excavation which is composed of a regular mid orange brown clayey silt supporting poorly sorted gravel clasts and a moderate amount ~10% angular chalk clasts.

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

**Building Materials**

**Digital:** 351/PR6007
Surviving. The presence of a coffin is shown through 14 coffin nails.

The grave was truncated by group 1095, and the two skeletons were found almost on top of one another. However, it is not possible to judge whether the skeleton 1052 was actually damaged by the truncation, due to its bad preservation.

At the NW corner of this group, is group 1020. A slight truncation has occurred at this point, but it is so slight that it is hard to determine which group is earliest.

**DESCRIPTION (See check lists):**

1. Fractured
2. Mid orange brown
   Bright whiteish brown
3. Clayey silt
4. 50% poorly sorted angular chalk clasts
   Frequent angular flint clasts - poorly sorted

**INTERPRETATION/DISCUSSION**

Backfill of grave composed of mixed soils and chalk cobbles, fragments with frequent occurrence of poorly sorted angular flint cobbles. Coffin nails, residual bone fragments, pottery sherds were recovered during excavation. The bone fragments may have belonged to SK.1158, which 1102 had truncated.

**DESCRIPTION (See check lists):**

This cell is for a large pit and its fills, [794] with multiple truncations of graves. The fills were therefore not always in physical contact. A roughly "L" shaped pit, with its corner to the NW survived intact.

**INTERPRETATION/DISCUSSION**

Group for large 3.0m dia. pit. [794] heavily truncated by multiple grave cuts.

**FINDS (tick):**

None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

△ Small Finds

◇ Samples

△ Building Materials

**RECORDED:** RW

**DATE:** 26/01/04

**INITIALS:** OJB
Due to multiple truncations, the surviving fills are partially isolated and not always in physical contact.

It was noted during excavation that (797) + (989) are very similar and a small amount of these deposits wrap around the eastern edge of [887]+[797].

They are likely the same deposit. As are (796) + (797) likely same deposit.

\[
\begin{align*}
(998) + (997) &= (796) \\
(996) + (994) &= (992) \\
(993) + (992) &= (797)
\end{align*}
\]

GRP. 1115.
This is group matrix for the features within the vicinity of grid 115, whether they truncate it or a feature related to it.

- 1082 - Skeleton

**Digital Shots**: 352/P1270028, 353/P1270029, 354/P1270030

**Interpretation/Discussion**

W-E aligned inhumation of adult female aged 50+ (subject to osteological analysis). Accompanied by coffin evidenced by 18 fixing nails (2832 + 2833 are probably the same nail but have been bagged separately as this was uncertain, there are . . . 19 + nails). The nails which would have fixed the lid were slightly displaced following

- **Finds (tick)**: None [], Pot [], Bone [], Flint [], Stone [], Burnt stone [], Glass [], Metal [], CBM [], Wood [], Leather []

- **Small Finds**: 2826 - 2844 (nails)
- **Samples**: 284 (skull), 881 (torso), 882 (feet)

**Recorder**: RB

**Date**: 27/1/04

**Initials**: AS
The decomposition of the coffin but comprised two nails each in the NE + SW corners (2830/2831 and 2832/2833 respectively) and one in each of the NE + SE corners (2830 + 2831 respectively).

Otherwise the nails were located at the base of the coffin and grouped in pairs (if 2832 + 3 are the same) from W-E as per sketch below, with two pairs at the eastern end.

Two groups of hobnails were also recovered from the eastern end of the grave (2847 + 2848) and from their position seem likely to have been worn on the feet at the time of burial.

Additionally an iron "stud" (2846) was recovered to the south of the Skull. This may have been a coffin fitting although was the only one of its kind in the grave and may represent have some other function.
The age and sex of the skeleton are conjectured from the lack of teeth and healed over mandible and the apparently slight stature respectively and are tentative interpretations.

Truncated at the eastern end by a post-hole burial (Cmp. 1130) not excavated as of 27.1.03 and dug out of sequence, but truncation itself slight minimal.

### Condition
- FAIR / POOR

### Plan No(s) (arch & phot)
- 431: 2030, 3030

### Section No(s)
- -

### Co-Ordinates
- Coffin in No. 6
- Coffin fittings in Nos. 3021, 3025, 3026, 3027, 3029, 3030

### Soil description (see Context 1126)
- redeposited chalk lumps in soil matrix

### Additional description
- Ribs are flexed across body, left arm is straight, legs are straight & parallel.
- Hands & ribs are missing, upper body is in very poor condition.

### Interpretation
- Adult male E-W scene, extended inhumation in a coffin (defined by 15 nails) in grave cut (1128). A pot (115) was placed on bottom of grave at E end outside of coffin. There were hobnails around each foot (3022/3023).

### Abdomen
- is in extremely poor condition + did not survive lifting.

**Digital Photograph:** 258/91010040

**Stratigraphic Matrix**

```
  ▲ context is ▼
```

**Interpretation/Discussion:**

"W-E aligned inhumation of neonate of indeterminate sex. No accompanying coffin or grave goods. Almost certainly truncated Group 1120 but was excavated out of sequence (only the westernmost 0.05m of group 1130 truncates the earlier grave so this error had no significant consequences.)"

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

**Small Finds:**

**Samples:** 898 (Saw) 899 (Remaining Efflux Collection)

"it is possible that a wholly wooden coffin may have accompanied the burial and the soil samples may provide further evidence if this was the case?"

"Only 0.3m deep although couldn't really be significantly deeper given dimensions of cut in plan."

Consists of:

Overlies: 5k1132

Level

Butts:

Slide No.

Cuts:

Neg No. Fill of: [1129]

Matrix location Relationships uncertain

Description (See check lists):

1. Compaction loose, even more
loose nearer to course (usual)
2. dirty brown/yellow +
chalk + compaction - 40% chalk lumps, 5% flint
3. stone 6mm - 20mm = 53%
5. 0.87 - 0.55m
6. 0.90m
7. A mixed earthy/chalky backfill very common

Interpretation/Discussion

Gravel backfill of cut [1129]. Pottery sheds
found (Roome?). Oyster shells found in this
deposit.

Finds (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ]

**STRATIGRAPHIC MATRIX**

```
\[ \text{Description (See check lists):} \]

- Grave Group Compensating
- 1023 Backfill
- 1022 Skeleton
- 1958 Grave Cut

The grave contained a supine W-E orientated male c. 35-40 yrs. The skeleton was within a coffin - nails in situ - but no coffin stain was detected. The grave was well constructed + deep cut. The edges were square, sides vertical & surveying depth was 1.2m.

- **Overlain by:**
- **Abutted by:**
- **Cut by:** 1102 (Group 1155)
- **Filled by:** 1159 + SK 1158
- **Same as:**
- **Part of:** Group 1225
- **Consists of:**
- **Overlies:**
- **Butts:**
- **Cuts:** Group 640 (Hedgeow feature)
- **Fill of:**

**Description (See check lists):**
1. Sub-rectangular
2. Flat base - steep sides
3. 2.40m length x 1.10m width x 1.15m depth
4. Heavily truncated by group 1155
5. Filled by SK 1158 + backfill 1159

**Interpretation/Discussion**
Grave cut, which is very heavily truncated by another, later, grave cut (Group 1155). The later grave cut was situated almost entirely over this grave and all that remains is the southern edge and west terminus of the cut. The grave cut also truncates heavily into the hedgeow feature - Group 640.

Soil description (see Context 1159...)

Additional description
Crushed remains of a skull only - which included several teeth.

Interpretation
These few remains of the burial were all that was left in situ after heavy truncation by a later cut grave - 11021.

**STRATIGRAPHIC MATRIX**

```
Number: 1159
401

this context is 1159
1158
```

**Description (See check lists):**

1. **Friable**
2. **Mid orange brown**
   - Dark orange brown
   - Pale whitish brown
3. **Clayey silt**
4. **Frequent poorly sorted angular chalk fragments and flint clasts**. Frequent bone fragments and occasional ceramic sherds.

**Interpretation/Discussion**

All that remained of this backfill was situated along the southern grave edge and the west-end terminus of the grave. Cut into the hedgerow feature (GROUP 640) the grave excavation and thus the backfill includes soils from the hedgerow along with chalk bedrock & flint clasts.

**Description (See check lists):**

This cut is for Grave Group:

F11087 (111)

Sk (1109) - only legs survived modern truncation by footing trench

SF's: Fe nails 2933, 2934 Samples: 909 collected from around the legs.

This grave is isolated & discreet. The young infant within has not survived in good condition.

**Interpretation/Discussion**

Young infant grave.

Not able to determine sex / age in field... only legs survive.

**DESCRIPTION (SEE CHECK LISTS):**

This context represents the coffin, which held sk. 1167. Its presence is indicated by coffin nails found in this grave arranged in a pattern that is very 'coffin-shaped'.

The dimensions of this coffin can be estimated at a 2 cm long by 0.5 cm. The grave itself seems very big for a coffin of this size.

**INTERPRETATION/DISCUSSION**

Remains of coffin (1168) represented by coffin nails.

**STRATIGRAPHIC MATRIX**

- **Description (See check lists):**
  - Group sheet for 1129. A grave cut + skeleton. This grave cut truncates 1129 at the eastern end.
  - 1170 = 1112 cut
  - 1113 fill
  - 1114 skeleton

- **Interpretation/Discussion:**
  - A well preserved skeleton, potentially female, age 20's?
  - Part of 3 graves - later than 1129, but unable to tell relationship with 1161

---

**Finds (tick):**

- Small Finds: 2936 - 2940 + 3002 - 3005
- Samples: 920 - 925 + 933
- Building Materials

---

**Recorder:** J.J
**Date:** 5/4/04
**Initials:** R.T.
Site: AV21

- Relationships uncertain

Description (See check lists):
1. Friable
2. Muddy, greyish brown
3. Chalky clay
4. Chalk lumps 70%
5. Uneven thickness 1.40m approx
6. Length 2.30m approx, width 0.95m approx

Interpretation/Discussion
Fill of Roman grave. Presence of animal bone within deposit suggest good last as offerings (or the workers backfilling it stopped halfway through to have lunch.)

Habnails 3234 are recorded as coming from this ctx but not located.

Finds (tick):
- None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ]
- CBM [ ] Wood [ ] Leather [ ]

as the coffin decomposed. And four appr. 0.05m from the base of the cut. The projected extent of the coffin is based on the location of the lower four nails (2961, 2, 3 +4) and the variation in the backfill between the area enclosed within these 4 nails (higher %age of re-deposited soil) and the backfill outside this area (considerably more re-deposited chalk + flint).

There were also traces of wood along the projected southern edge of the coffin. The lower four nails fixed the base of the coffin + the upper four (2959, 60, 65 +66) the lid.

Also accompanying the burial within the projected extent of the coffin was an iron knife (2169) to the south of the right knee; a Cu Alloy...
Buckle (2968) wedged below the broken epiphysis of the left femur and a Cu alloy coin (2967) on the upper vertebrae. The coin was almost certainly originally placed in the mouth as the teeth on the left hand side of the maxilla and mandible were stained green. The buckle may have been fastening a belt around the waist and shifted to its 'current' location during decomposition. The knife was badly corroded and the top of the handle broken off but still present.

The body had been laid out with the right hand placed on the right chest, the left hand on the pelvis and the right foot crossed over the left (ref. sketch).

Relatively high and "large" assemblage of pottery and bone from within upper backfill possibly a result of re-deposition of ditch fills from group H50.

Two anomalous flake objects (2970 + 2971) were also recovered, one (2971) which looked remarkably like a hobnail and was recovered near the feet, although in isolation.

And another hobnail or stud(s)? from the backfill overlying the skull.

The latter may have been a coffin fitting or some description.

This context was allotted to a Skele because upon excavation only 2 powdery smudges of bone were detected. The base of feature was then sampled 963 under this context. Incase processing may reveal more bone. No diaries/photos taken of smudging... with the light tan soil not much would have shown up. There was something here but nil has survived.

Deposit collected because of bone smudges seen.

**Description (See check lists):**

THIS CTX IS FOR CREMATION GROUP

[402]

**BURNT DEPOSIT** (1121)

**OVERLAYING DEPOSIT** (1122).

*S.F. - cu coin 3013 - NOT INSITU.*

**SAMPLE** & **9 statues - 12 x 10 L buckets = 100%**

THE SECTION RECORDED *101* + *230* IS ON A VERY OBlique ANGLE TO GRAVE CUT, MAKING IT APPEAR MORE PIT LIKE THAN ITS TRUE SUBRECTANGULAR GRAVE CUP LIKE APPEARANCE. THE FILL WAS RICH CHARCOAL (COFFIN BURNT WITH SEVERAL SMALL FE NAILS ALONG NINE END ALL HEAD UP...PLANNED BUT NOT S.F. - COLLECTED IN SAMPLE). ABUNDANT BURNT BONE THROUGHOUT DEPOSIT BUT NO VISIBLE STRUCTURAL/ARTICULATED JOINTS.

FOR GROUP MATRIX SEE ADD SHEET #2 CTX 1115.

---

**Finds (tick):** None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

- Small Finds
- Samples
- Building Materials

**Recorder:** RW

**Date:** 02.02.04

**Initials:**
A grave/cremation deposit was planned with very rectangular limits within the cut. Several bone fragments, possibly decorated, were collected together in 93.6 kg of 12 x 10L buckets, very similar to GRP 655 (and close in proximity too!).

The grave exists almost entirely within the confines of a larger, deeper grave cut, not yet identified.

**Matrix location:**

**DESCRIPTION (SEE CHECK LISTS):**

1. Compact  
2. Light Tan, White  
3. Smokey Mid Tan  
4. Sand  
5. 0.38m Thick  
6. 2.0m x 0.70m W  
7. This Fill was Very Pale and Almost All Re-deposited Chalk. Not Visible in Plan. Only Noted in the Side of [544]. - Returned to Investigate.

8. Wet, Cloudy, Grizzly / Travel Matrix.

**INTERPRETATION/DISCUSSION:**

This is back fill for [1196] GRP 1270.

- Makes you wonder how many other grades could there be, like this one, with extremely pale backfill difficult to discern from natural surrounding it.

**Description (See check lists):**

- Group No. for grave.
- Consists of: cut (1128).
- E-W spine, male, adult extended skeleton (1127) in a coffin defined by 15 nails.
- 
  1308 1309 13010 13011 13012 13014 13015 13016 13027 13024 13025
  13026 13027 13029 13030. The skeleton was wearing hobnail boots (13032 + 13033). A pot (13034) (115) was placed on S side of grave cut at extreme E end outside of coffin. The grave coincided with (1126).

**Interpretation/Discussion**

- U-E adult male interment in coffin (defined by nails).
- A pot (115) was placed at E end outside of coffin. The skeleton had hobnails around R + C feet (13032 + 13033).
- 2 animal teeth were found around the feet area.

between (ref. sketch below). The bowl is 0.14m in diameter at the rim and approx. 0.05m in depth altogether. The bowl has split down the middle in a predominantly clean break in antiquity.

(i) A New Forest ware flagon approx. 0.15m in height and 0.11m at its widest. No decoration was evident during excavation.

In addition to the six fixing nails, an Fe object of similar dimensions to the nails (7069) was recovered to the east of the skull. This may prove to be a further nail but may be part of a ?brooch as the head differed from the other nails recovered ????

NB: The lower legs do not appear on the photographs as they were beneath vessel 1146.

**Additional description**

Right hand resting on pelvic bones appear in good condition but break up easily when lifted. Right foot in very disturbed - the bones are quite scattered but for no obvious reason. The right humerus, radius, femur and tibia are all broken due to the grave edge collapsing in.

**STRATIGRAPHIC MATRIX**

- Level 400
- this context 1210
- 1629

**Interpretation/Discussion**

This group consists of an adult male in a coffin in a W-E aligned grave cut. The skeleton is in very good condition and had a pair of hobnailed shoes laid out beside his right leg, which were also in good condition showing the outlines of hobnailed.

**Finds (tick):**

**Initials**  RB
Two shoes (see plan 524)
The presence of a coffin is shown by 24 coffin nails.
The grave cut was very deep, measuring 1.8m in the centre.

For full matrix see 1645
Patches of carbonised coffin wood fractures. In plan they clearly reveal the outline of the coffin.

Carbonised coffin wood

For full matrix see 11645

**Description (See check lists):**

**This CTX is **CREMATION GROUP**

1. **Cut (1147) CREMATION DEPOSIT (149) BACKFILL**
2. **No SEs. Sample 957 = 100% = 7 bone.
3. **DISI 430 194040035.**

**Interpretation/Discussion:**

- **This cremation deposit looks to be within a grave cut, with ample charcoal to suggest a coffin or plenty of wood for fuel for the burning.
- **The deposit was up to 150mm thick in places. The cremated/burnt bone that survives is well spread throughout deposit. No articulation was noted. The upper backfill was a standard looking grave fill with several bird bones and joining teeth.
- **GRP 1195 is cut into Top Fill + completely within 1215's perimeter.**

1. LOOSELY CONSOLIDATED
2. WHITE, GEMISH PINK.
3. CHALK / SOIL / ELEMENTS OF TRUNCATED PIT FILL
4. OCCASIONAL FLINT INCLUSIONS / ALSO POT / CHARAL
5. 1.6 M THICK
6. 2.4 M X 0.8 M
7. BACKFILL OF GRAVE [1217]

**Interpretation/Discussion**

BACKFILL OF GRAVE [1217]

BACKFILL CONTAINED REASONABLY LARGE AMOUNTS OF PIT AND CHARAL BONE.

THIS APPEARS TO HAVE COME FROM PIT FILLS THROUGH WHICH THIS GRAVE IS CUT.

IT IS INTERESTING TO NOTE THAT THE MAJORITY OF CHARAL BONE FROM THIS BACKFILL BELONGS TO A HUMAN FOOT. THIS MIGHT SUGGEST THAT EITHER A BURIAL WITHIN THE PIT HAS BEEN TRUNCATED, OR HUMAN REMAINS WERE DUMPED IN PIT - HEAVILY  STILL ARTICULATED.

**Initials:** BJS
The right side of the skeleton — from the legs up — is in a far worse state than the left hand side. Possibly during decomposition the fluids from the internal organs collected around the southern edge/side of the coffin and therefore affecting the right hand side of the skeleton more. The base of the grave cut does indicate that the southern edge is at least 0.10m lower than the northern edge.

## Interpretation/Discussion

Remains of coffin within grave 1226 surviving as a differential stain within the grave backfill. 1228 existed as a single deposit above, around & below skeleton 1224. The staining extends beyond the coffin fittings (rivals), presumably the rotting coffin affected the backfill around it.

Group no. for a grave.

It consists of cut (II74).

Skeleton (II73)

Fill (II72).

The skeleton was in a coffin, defined by 16 (possibly 18) nails.

No grave goods.

A coin (3150) was found under the right hind side ribs.

Interpretation/Discussion

Grave Group no for an E-W (head to W) adult male, extended.

Supine inhumation in a coffin (defined by nails) in grave cut (II74) + backfilled with (II72). No grave goods.

The grave has been heavily truncated by the building of the school.

A coin was found under the right rib cage. Was it placed in the coffin or the grave? Or in a pocket?

Relationships uncertain

Description (See check lists):

This context is for Grave Group :

[1176], [1178] - Sample 963 taken because only bone survives,
(1177) - Grave Back Fill.

This Grave was heavily impacted by machine cuts for footing trench and stripping of site.

Interpretation/Discussion

Grave of V. Young / Small Individual.

Recall during 1st cleaning of this region I followed this cut down 15cm. Upon revealing this fill (1149) was visible. Therefore, I believe that this group cuts group 1245 (1147).

For group matrix see add sheet #2 CTX 115.

**Interpretation/Discussion**

Grave cut for interment (1247)

It has been heavily infiltrated to the E by grave 1330 and probably by (1335) (but see Plans of skeleton + cuts to verify it)

*It may be that 12487 has cut the feet of skele (1258) before itself was infiltrated by (1337)*

**Description (See check lists):**

1. Irregular rectangle.  
2. Irregular sides, sloping to uneven base. 3.13m, width 1.03m, 0.52m - 0.8m, depth 0.49m S.

**Interpretation/Discussion:**

Irregular feature, potentially a tree throw, that is close to a grave cut, and at first was thought to have been a grave – no finds or skeleton.

**Potential tree throw.**

This context is for Cremation Group: E11847 (188) + Vessel (186) with Contents (1187)

This group has a shallow cut pit with an upright intact pottery vessel (contents intact but not investigated) since this group's location is so near other cremations and grave. The assumption has been that it is likely a cremation urn - that being the case, the pot was lifted intact for its contents to be processed in the lab.

Likely cremation in surviving vessel.

**Soil description** (see Context 1257) re-deposited chalk [map]

**Additional description**
Skeletor lies on L side with arms extended away from body. Head at E.
Most of legs are truncated by later grave.

**Interpretation**
Adult male E-W (head at E) skeleton lying on L side. Not in a coffin. No grave goods, some large flint nodules were placed around the skull & along the back of the spine.

**Hand-drawn diagram:**
- Truncated by 1259
- Truncated by 1282

**Description (See check lists):**

This Group is for Grave [1197] & Skeleton [193] - only surviving in small savoy patches. Collected as sample on 2 x bago - sk. [1193] suspended in [1194].

This grave was covered with plastic and left from start of site.

It was heavily truncated by blqg. Works and again during arc.

Stripping - Deeper portion surviving is in western end (0.11 m deep).

There was a further "anomalous" nail in the north-west corner (3202) which may merely have been an additional fixing nail for that corner (?!)

The burial was also accompanied by what appears to be the central ribs and "rolled" Cu Alloy rivets of a bone comb (Clarke: Type C composite, double sided ?) 3207, although no lateral teeth segments were recovered. This was in close proximity to the skull and may have been worn in the hair at the time of burial ??? There is also evidence of the rivets although the Cu Alloy ones predominate.

There had been partial collapses of the upper edges of the cut where it truncates ditch group 450, hence the more irregular shape in plan.

**Initials** MB
nail 3211 was found in an odd position as it was on the same level as the lid of the coffin but was placed where the centre of the lid would have been. It was lying on its side and did not appear to be coffin furniture. It is also odd that it has not corroded at all unlike the other nails. It is thought to be a real object, placed on top of the coffin after the coffin was put in the ground.

Carbonised coffin wood, 1211, also showed the location of the coffin.

**STRATIGRAPHIC MATRIX**

- This context is

**Interpretation/Discussion**

This group contains an adult skeleton in a good state of preservation. 5 coffins confirm that a coffin existed. The body of a male (35-40 years) is laid facing E-W oriented grave cut.

**Finds** (tick): None [ ] Pot [ ] Bone [ ] Flint [ ] Stone [ ] Burnt stone [ ] Glass [ ] Metal [ ] CBM [ ] Wood [ ] Leather [ ]

**Description (See check lists):**

**Fragile**

Darker orange/brown

81 York City

0.10m Thickness

Dimensions 0.46 x 0.25 x 0.48m WAX N/S

*mud brick - dry & uncracked*

**Interpretation/Discussion**

Dark brown stain surrounding & beneath infant skeleton 1287. The skeleton is in a slightly crouched position - but not foetal. If the bones especially tight together so (293) does not seem to derive from something the infant was wrapped in. It presumably derives from the decomposition of the skeleton itself.

**STRATIGRAPHIC MATRIX**

- Relationships uncertain 1308

**Matrix location**

- 1308 1309 1311 1312

**Description (See check lists):**

1. Linear
2. Shallow concave base - gradual break of slope with steep / 70° sloped sides
3. 1.0m width x 0.55m depth

**Interpretation/Discussion**

Regular shaped ditch cut orientated east - west and excavated in to chalk bedrock.

Graves located immediately beside the south edge of ditch. Probably a former cemetery boundary ditch. Filled by four distinguishable deposits.

**RECORDED BY**

Date: 13-2-04

Initials: KB
coffin. (Nail types also vary with square + round hooked.)
Also accompanied by bone-handled Fe. Knife 33644,
possibly held in left hand.
Both arms are flexed at the elbows although
the right arm is also raised at the shoulder,
whether this is a deliberate "laying out" or the
body has moved during decomposition is unclear,
although the fact that the right femur is also
displaced may suggest a degree of movement
'post-interment'.

A number of the thoracic vertebrae appear to
be f (at least partially) fused together (ref. sketch).
High concentration of charred throughout backfills
belonging to truncated graves (gr. 1340 + unexcavated grave).
Other intercutting graves have contained no charred so
treatment of disturbed burials presumably altered over time (assuming...
That this grave is relatively late.

**STRATIGRAPHIC MATRIX**

---

**Description (See check lists):**

**DITCH CUT:** 1307 = 1424 = 1428 = 1435

**FILL:** 1308 = 1435 = 1429 = 1436.

**FILL:** 1309 = 1436 = 1440 = 1449.

**FILL:** 1311

**FILL:** 1312

**SECTION:** 240, 243, 244, 245

**PLAN:** 585, 611

**INTERPRETATION/DISCUSSION:**

Straight regular shaped ditch cut oriented east-west. 3rd of four er. along N. boundary of site. with Grp. 1430 to North & Grp. 1352 to South. Successive of successive phases to boundary expansion.

**Description (See check lists):**

Loose

Mid brown

Silt Clay

Chalk fragment + small fragments of flint

Dimensions: 1.72m (length e/w) 0.84m width N/S

**Interpretation/Discussion**

Coffin Stain within grave 1292 - had a very clear contact with the grave backfill. The deposit was observed above, around, & beneath skeleton 1341.

**DESCRIPTION:**
- Group No. for a cremation.
- It consists of: cremation (1238) cut (1239)
- It contains a few sherds of pot suggesting it may once have been in an urn.
- It contained 7 nails.
- It cuts the fill of grave group 1335.

**INTERPRETATION/DISCUSSION:**
- A very shallow heavily disturbed cremation.
- Prob disturbed by modern terracing.

---

**Description (See check lists):**

1321 - Grave Cut
1322 - Grave Backfill

Skeleton completely truncated with the exception of one fragment of rib - possibly human.

---

**Interpretation/Discussion**

Heavily truncated SW-E aligned grave

One fragment of possible human bone recovered from backfill (1322). Large quantity of dental from fill of truncating group 1310 - some of which will have originated from this grave (1310 also truncates group 1340 and some of the dental will be from there) →
